

Health Care General & Domestic Security Joint Committee Meeting

Thursday, November 10, 2005 1:00 PM – 4:00 PM Morris Hall

COMMITTEE MEETING PACKET

Committee Meeting Notice HOUSE OF REPRESENTATIVES

Speaker Allan G. Bense

Health Care General Committee

Start Date and Time:

Thursday, November 10, 2005 01:00 pm

End Date and Time:

Thursday, November 10, 2005 04:00 pm

Location:

Morris Hall (17 HOB)

Duration:

3.00 hrs

The Health Care General Committee along with the Domestic Security Committee will meet jointly for an Overview of State and Local Hurricane/Disaster Preparedness and Response.

Presentations by:

Department of Community Affairs Division of Emergency Management

Department of Health

Agency for Health Care Administration

Department of Elder Affairs

Charlotte and Escambia Health Departments

Charlotte, Escambia, Martin, Miami-Dade, and Orange County Emergency Management Officials

Broward County Mobile Medical Mission October 29-November 7, 2005

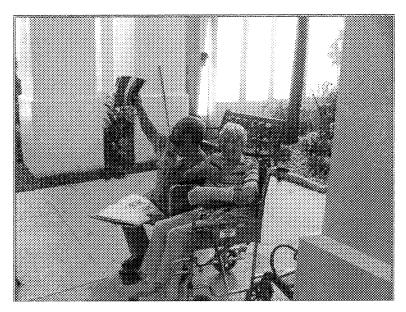

- 2,907 patients seen at more than 50 sites over 10 days
- Majority of visits related to:
 - Insulin for diabetics
 - Injury/laceration treatment
 - Prescription refills
 - Blood pressure checks for hypertensives
- More acute care needs emerging (asthma, animal bites, etc.)
- > 12,700 high-priority housing units (elevated/without power, mobile home parks, etc.) were approached on medical reconnaissance and triage missions
 - doors answered at about 5000 (40%) of units approached
 - Approximately 10% of those at home needed medical care

Broward County Mobile Medical Mission

HHS Florida SERT Centers for Disease Control and Prevention

Coordination of CDC Assets

- 15 Florida-based field PHAs doing immediate medical needs assessments with County/PHS mobile medical vans
- 10 CDC Epi staff to assist state and EMAC teams doing rapid needs assessments
- 2 DEOC staff to assist SMO in state EOC

12 CDC medical staff as part of the PHS medical teams

HHS Florida SERT Centers for Disease Control and Prevention

Rapid Assessment Teams

- 210 interviews with 42 clusters representing 375,580 households in northeastern Broward County
- Survey also conducted in Hendry County in 91 households resulting in similar data.
- More than 26% of homes in area suffered some damage
- More than 71% using bottled water
- More than 12% without access to 3-day food supply

5-15% of households have one or more medical need(s)

The types of public facilities that should be constructed to comply with the public shelter design criteria include all facilities that are subject to be used as public hurricane shelters under the authority of section 252.385(4)(a), Florida Statutes; that is, public schools, community colleges, universities, and other facilities owned by state and local governments. When appropriately located, designed and constructed, the following types of facilities are normally considered suitable for use as public hurricane shelters:

Community and civic centers, meeting halls, gymnasiums, auditoriums, cafeterias and open floor multipurpose facilities, exhibition halls, sports arenas, field houses conference and training centers, certain classroom buildings, and other public assembly facilities.

Certain other types of facilities may be inappropriate for use as public shelters due to location (e.g., Category 1, 2 or 3 hurricane evacuation zone, flooding isolation, hazardous materials, low evacuation demand, etc.), size (e.g., less than 2,000 square feet of usable floor area, etc.), or other characteristics (e.g., incompatibility of facility's normal use or availability with mass care function, long-range planning considerations, etc.)

District school boards have generally been reporting that the construction cost premium for incorporating the criteria is about two to six percent. This is a relatively small, but not necessarily insignificant, cost that must be borne by state and local agencies. Therefore, s. 1013.372(2), F.S. requires that the Department recommend an appropriate and available source of funding for the additional cost of constructing emergency shelters. There is no dedicated state source of funding to support new hurricane shelter construction, so the Department recommends use of existing state capital outlay funds.

The only significant and appropriate funding source available at this time for public schools, community colleges and universities is Public Education Construction Outlay (PECO) funds. These funds are earmarked for site acquisition and improvements necessary to accommodate buildings, equipment, and other structures of district school boards, community colleges and universities. Therefore, the Department recommends PECO funds, which are an appropriate and available source of state funding. From time to time, other federal and state mitigation-related funds may be available to support the construction cost premium for improving hurricane resistance above minimum code requirements for new facilities. However, the mitigation funds are not considered normally "available" for most new construction projects, since their grant cycles are often associated with disaster declarations.

The Department's Division of Emergency Management (the Division) has statutory responsibility and authority to administer a statewide program to eliminate the deficit of "safe" hurricane shelter space. To ensure consistency with state and national standards, guidelines and "best practices," the Division has recognized Standards for Hurricane Evacuation Shelter Selection (ARC 4496) as the minimum hurricane shelter survey and evaluation criteria. Therefore, at a minimum, meeting ARC 4496 criteria is a

required condition for a public facility to be described as "safe", "suitable" or "appropriate" for use as a public hurricane shelter. To accomplish this objective, the Division has implemented a multifaceted program. This program includes: 1) survey of existing buildings, both public and private, to identify suitable shelter capacity; 2) where cost effective (and practical), support mitigation and retrofitting of existing facilities to increase shelter capacity; 3) construction of new facilities to meet the public shelter design criteria; 4) shelter demand reduction through improved hurricane hazard models and behavioral studies; and, 5) improve public information/education to reduce unnecessary "shadow" evacuations.

Cumulatively, since 1995, the Division's hurricane shelter survey and retrofit program has identified, created or otherwise documented about 434,000 hurricane shelter spaces that meet ARC 4496 guidelines. Public school new construction programs have created an additional 299,654 hurricane shelter spaces. Therefore, by the 2004 hurricane season, Florida will have a total of about 643,719 shelter spaces that meet ARC 4496 guidelines. The demand for hurricane shelter space has also been significantly reduced over the past five years due to improvements in public information, storm hazard models and more accurate census data. Since 2000, Florida's deficit of hurricane shelter space has been reduced by at least 50 percent, and the Division estimates that about 100,000 spaces will be added to the state's inventory each year. As can be seen in Figure EX-1, the Department estimates that the hurricane shelter space deficit may be eliminated by 2011.

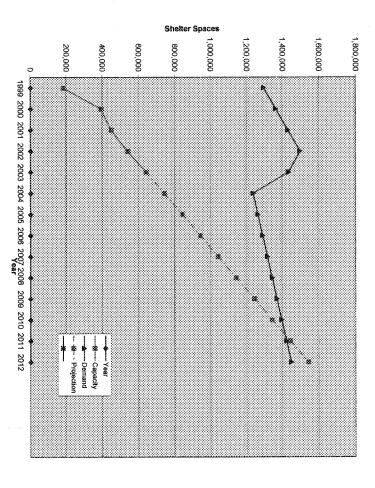

Since publication of the 2000 Statewide Emergency Shelter Plan, Florida now has 12 counties with demonstrable surpluses of hurricane shelter space. The counties with surpluses include Brevard, Broward, Escambia, Gilchrist, Indian River, Madison, Miami-Dade, Martin, Osceola, Seminole, Union and Washington. Also, for the first time in recent history, Florida has a region with a demonstrable surplus of hurricane shelter space. RPC 11, which includes Broward, Miami-Dade and Monroe counties, has a surplus of hurricane shelter space.

As Florida's hurricane vulnerable population continues to grow, it is vitally important that construction of hurricane shelters and retrofitting of existing buildings be considered a priority. If this state is to meet its goal of eliminating the hurricane shelter space deficit, the incorporation of the public shelter design criteria into new construction, retrofitting of suitable existing buildings and continued use of new technologies must continue to be accomplished. The overall result of full implementation of the Department's shelter deficit reduction strategy is a greater level of preparedness, a more efficient capability for responding to incidents and a greater ability to meet the needs of disaster victims.

2004 Statewide Emergency Shelter Plan

Figure EX-1. Projected Hurricane Shelter Deficit Reduction

Hurricane Shelter Status

Department of Community Affairs 2004 Statewide Emergency Shelter Plan

1.0 INTRODUCTION

1.1 Purpose of Statewide Emergency Shelter Plan

Pursuant to section 1013.372(2), Florida Statutes (F.S.), the Statewide Emergency Shelter Plan, hereafter referred to as the Plan, is prepared and submitted to the Governor and Cabinet for approval. The Plan provides information on existing and long-term hurricane evacuation shelter space requirements. This information is then used by district school boards, community college boards of trustees, university boards of trustees and emergency management agencies in planning for the construction of new educational facilities to comply with the public shelter design criteria. "Board," unless otherwise specified, means a district school board, a community college board of trustees, and a university board of trustees.

This Plan, once approved, will determine which regions and counties are required to construct new educational facilities to comply with the public shelter design criteria. The Plan includes: the general location and square footage of existing shelters by region and county; the general location and square footage of needed shelters by region and county for the next five years; the types of facilities that should comply with the public shelter design criteria; and recommends an appropriate and available source of funding for the additional cost of constructing public hurricane shelters in those public facilities.

Since promulgation of the public shelter design criteria in 1997, the Department has routinely received requests for guidance on certain aspects of the criteria. Therefore, based upon standard responses, this Plan also includes consultative guidance by the Department on subjects relating to implementation of the criteria; minimum mass care/human needs requirements not specified in the code, explanation of exemption criteria, etc. The guidance is not intended to be a comprehensive commentary of the criteria, but is limited to subjects pertinent to the most frequently asked questions. This Plan also includes a brief progress report of statewide hurricane shelter space deficit elimination.

1.2 Background and Chronology

On August 24, 1952, Hurricane Andrew made landfall in South Florida as a Category 5 hurricane. Winds in excess of 145 miles per hour spread inland, causing catastrophic damage in some areas of south Miami-Dade County. It has been estimated that 750,000 persons heeded appropriate warnings and evacuated coastal areas, inland flood prone areas, and manufactured homes. In some cases, spontaneous (or "shadow") evacuation of persons outside of areas ordered to evacuate also occurred. Though many evacuees sought shelter in motels or the homes of family and friends, many also sought safety in public shelter facilities in the affected area, and in communities along evacuation routes throughout the state. This unprecedented relocation of Florida's

citizens and visitors in the face of an impending natural disaster stretched the resources of state, local, and private agencies to provide public shelter.

Post-disaster evaluations of evacuation and sheltering concerns by the Governor's Disaster Planning and Response Review Committee, known as the Lewis Commission Report, identified the lack of adequate and appropriate public shelter space as a critical planning issue. The Lewis Commission Report served as the driving force behind the writing of Chapter 93-211, Laws of Florida, and subsequent revisions to Chapters 235, 240 and 252, Florida Statutes. The educational facilities sections of Chapters 235 and 240 have been superseded by Chapter 1013, Florida Statutes. Based on those revisions, the Legislature clearly stated its intent that Florida not have a deficit of safe public hurricane shelter space in any region of the state.

One of the statutory revisions required that the Department of Education, in consultation with boards and county and state emergency management offices, develop standards for a public shelter design criteria, which were to be incorporated into State Requirements for Educational Facilities (SREF). The new criteria were to be designed to ensure that appropriate new educational facilities can serve as public shelters for emergency management purposes. After promulgation of the criteria, all new educational facilities, or appropriate areas within facilities, for which a design contract was entered into after the effective date of the inclusion of the public shelter criteria in SREF, must be built in compliance with the criteria, unless the facility is exempted by the applicable local emergency management agency or the Department.

The Department of Education entered into a contract with the University of Florida, School of Building Construction, to prepare the shelter design criteria. The university assembled an advisory committee consisting of members from federal, state and local emergency management agencies, architects, engineers, district school boards and shelter operations experts from the American Red Cross (ARC). The task before the advisory committee was to develop criteria that balanced the need to provide a relatively safe and self-sufficient facility, with the need for cost-effective designs and construction methods.

The advisory committee incorporated not only its collective knowledge, expertise and existing national codes and standards, but also consulted with Texas Tech and Clemson Universities for severe storm research findings, and with relevant publications, such as the American Red Cross' Mass Care—Preparedness and Operations (ARC 3031, superseded by ARC 3041), Guidelines for Hurricane Evacuation Shelter Selection (ARC 4496), and the Department of Energy's (DOE) Standard Natural Phenomena Hazards Design and Evaluation Criteria (DOE-STD-1020).

The product of this process was a set of comprehensive design criteria that included structural enhancements, potable water and sanitary requirements, provisions for emergency power, and other considerations that would improve survivability and shelter management operations. The promulgation process began in 1994, and was finally adopted into SREF on April 28, 1997 (see Appendix B). Subsequently, along with other sections of SREF, the criteria were incorporated in Chapter 423 of the Florida Building

Code (FBC), which became effective March 1, 2002. This provided a seamless continuation of the criteria for new school construction projects.

The sheltering lessons learned from Hurricane Andrew were further reiterated by the experiences of Hurricane Floyd in 1999. During that event, approximately two million people in Florida alone evacuated from the storn; 19 counties along the entire Atlantic coast were under a hurricane or inland high wind warning, and 17 counties issued mandatory evacuation orders for their storm surge vulnerable and manufactured home residents. Of the 67 counties in the state, 58 opened a total of 379 shelters that housed 87,191 evacuees.

Clearly in a large-scale emergency, the availability of shelters is a statewide challenge. Cumulatively, even if a small number of counties have shelter space surpluses, deficits in any county have statewide implications that must be addressed, at a minimum, at the regional level. Evacuees that cannot find shelter space within their own county or region will leave those areas in search of viable shelter alternatives elsewhere. Implementation of the public shelter design criteria in new educational facilities is a critical component of Florida's hurricane shelter space deficit elimination program.

1.3 Statutory Considerations

There are several statutory authorities that are applicable for implementation of the public shelter design criteria. The following statutes have been selected to provide context for decisions relating to planning, construction and exemption of educational facilities.

252.38 Emergency management powers of political subdivisions.--Safeguarding the life and property of its citizens is an innate responsibility of the governing body of each political subdivision of the state.

(1) COUNTIES .--

(d) During a declared state or local emergency and upon the request of the director of a local emergency management agency, the district school board or school boards in the affected area shall participate in emergency management by providing facilities and necessary personnel to staff such facilities. Each school board providing transportation assistance in an emergency evacuation shall coordinate the use of its vehicles and personnel with the local emergency management agency.

In s. 252.38, F.S., the Legislature states that "Safeguarding the life and property of its citizens is an innate responsibility of the governing body of each political subdivision of the state." This places the burden for evacuating and sheltering at-risk citizens during an emergency upon county governing boards (i.e., Boards of County Commission). To expand and expedite locally available resources to meet an emergency situation, the Legislature directed that during a declared state or local emergency, district school boards will upon request participate in emergency management by providing facilities, personnel, equipment, vehicles, etc.

District public schools are the primary source of public shelter during emergencies, currently accounting for about 93 percent of statewide hurricane shelter space. Therefore, it can be presumed that public schools will be used as hurricane shelters, and often staffed by district personnel. It can also be presumed that in most cases, public schools will be opened as shelters regardless of the storm's intensity and track. Therefore, it is critical that new school facilities be appropriately designed and located to serve the required emergency function.

252.385 Public shelter space.

- (1) It is the intent of the Legislature that this state not have a deficit of safe public hurricane evacuation shelter space in any region of the state by 1998 and thereafter.
- (2) The division shall administer a program to survey existing schools, universities, community colleges, and other state-owned, municipally owned, and country-owned public buildings and any private facility that the owner, in writing, agrees to provide for use as a public hurricane evacuation shelter to identify those that are appropriately designed and located to serve as such shelters. The owners of the facilities must be given the opportunity to participate in the surveys. The 'Board of Regents, district school boards, community college boards of trustees, and the Department of Education are responsible for coordinating and implementing the survey of public schools, universities, and community colleges with the division or the local emergency management agency.
- (4)(a) Public facilities, including schools, postsecondary education facilities, and other facilities owned or leased by the state or local governments, but excluding hospitals or nursing homes, which are suitable for use as public hurricane evacuation shelters shall be made available at the request of the local emergency management agencies. Such agencies shall coordinate with the appropriate school board, university, community college, or local governing board when requesting the use of such facilities as public hurricane evacuation shelters.

In s. 252.385, F.S., the Legislature stated its intent to eliminate the deficit of "safe" public hurricane shelter space. The Department's Division of Emergency Management (the Division) was given both the responsibility and authority to administer a statewide program to survey public facilities to identify those that are appropriately designed and located to serve as public shelters. The owners of the facilities to be surveyed are responsible for coordinating and implementing the survey with the Division and applicable local emergency management agencies.

To ensure consistency with state and national standards, guidelines and "best practices," the Division has recognized ARC 4496 as the minimum hurricane shelter survey and evaluation criteria. Therefore, at a minimum, meeting ARC 4496 criteria is a required condition for a public facility to be described as "safe", "suitable" or "appropriate" for use as a public hurricane shelter. The public hurricane shelter capacities listed as suitable in this Plan are recognized by the Department as meeting ARC 4496 safety criteria. The capacity lists include facilities that meet ARC 4496 heir existing condition (i.e., as-is), facilities that have been retrofitted to meet ARC 4496, new school facilities that are reported by district school boards and local emergency management agencies as having been constructed to the public shelter design criteria are generally assumed by the Division to meet ARC 4496.

In s. 252.385(4)(a), F.S., the Legislature directs that all suitable public facilities owned or leased by state or local government agencies shall be made available for use as a public hurricane shelter upon request of the applicable local emergency management agency. This broadens the types of facilities that can be used by emergency management officials in a declared emergency, and is consistent with the Division's authority to survey all appropriate public facilities for use as public hurricane shelters.

1013.372 Education facilities as emergency shelters.--

(1) The Department of Education shall, in consultation with boards and county and state emergency management of fiftices, include within the standards to be developed under this subsection public shelter design criteria to be incorporated into the Florida Building Code. The new criteria must be designed to ensure that appropriate new educational facilities can serve as public shelters for emergency management purposes. A facility, or an appropriate area within a facility, for which a design contract is entered into after the effective date of the inclusion of the public shelter criteria in the code must be built in compliance with the amended code unless the facility or part of it is exempted from using the new shelter criteria due to its location, size, or other characteristics by the applicable board with the concurrence of the applicable local emergency management agency or the Department of Community Affairs. Any educational facility located or proposed to be located in an identified category 1, 2, or 3 evacuation zone is not subject to the requirements of this subsection. If the regional planning council region in which the county is located does not have a hurricane evacuation shelter defect, as determined by the Department of Community Affairs, educational facilities within the planning council region are not required to incorporate the public shelter criteria.

In s. 1013.372(1), F.S., the Legislature directed the Department of Education to develop criteria, in consultation with district boards and state and local emergency management offices, to ensure that appropriate new educational facilities can serve as public shelters for emergency management purposes. The criteria are required to be incorporated into the State Requirements for Educational Facilities (SREF) of the Florida Building Code (i.e., s. 423.25, FBC), and all facilities for which a design contract is entered into after incorporation of the criteria into the code must be built in compliance with the criteria. The public shelter design criteria are applicable to both district school board and community college facilities, and became effective on April 28, 1997. The criteria were subsequently incorporated into the FBC on March 1, 2001.

The statute indicates that a board may exempt a facility from the criteria due to location, size or other characteristics that cause the facility to be mappropriate for use as a public shelter, with the concurrence of the applicable local emergency management agency or the Department. A facility that is located, or proposed to be located, in a Regional Planning Council region that is determined by the Department to have a hurricane shelter surplus may also be exempted. It is unlawful and a violation of the Florida Building Code for a board to exempt a new educational facility from the criteria without the written concurrence of the applicable local emergency management agency or the Department.

1013.74 University authorization for fixed capital outlay projects.--

(4) The university board of trustees shall, in consultation with local and state emergency management agencies, assess existing facilities to identify the extent to which each campus has public hurricane evacuation shelter space. The board shall submit to the Governor and the Legislature by August 1 of each year a 5-year capital improvements program that identifies new or retrofitted facilities that will incorporate enhanced hurricane resistance standards and that can be used as public hurricane evacuation shelters. Enhanced hurricane resistance standards include fixed passive protection for window and door applications to provide mitigation protection, security protection with egress, and energy efficiencies that meet standards required in the 130-mile-per-hour wind zone areas. The board must also submit proposed facility retrofit projects to the Department of Community Affairs for assessment and inclusion in the annual report prepared in accordance with s. 252.385(3). Until a regional planning council region in which a campus is located has sufficient public hurricane evacuation shelter space, any campus building for which a design contract is entered into subsequent to July 1, 2001, and which has been identified by the board, with the concurrence of the local emergency management agency or the Department of Community Affairs, to be appropriate for use as a public hurricane evacuation shelter, must be constructed in accordance with public shelter standards.

In s. 1013.74(4), F.S., state university boards of trustees have statutory authorities and responsibilities similar to those of district public schools and community colleges. State universities, in consultation with state and local emergency management agencies, are directed to assess existing facilities to identify the extent to which each campus has public hurricane shelter space. Each campus is then responsible for developing a five-year capital improvements program that identifies potential new and retrofitted facilities that can be used as public hurricane shelters. The statute indicates that the facilities will incorporate "enhanced hurricane resistance standards" and must be constructed in accordance with "public shelter standards," but does not specify the FBC's public shelter design criteria. The Department recommends use of the FBC's public shelter shelters that are appropriate for use as public shelters. All campus buildings for which a design contract is entered into after July 1, 2001 are required to be constructed to the standard.

The statute indicates that a university board of trustees may exempt a facility from the criteria with the concurrence of the applicable local emergency management agency or the Department. A facility that is proposed to be located in a Regional Planning Council region that is determined by the Department to have a hurricane shelter surplus may also be exempted. As with district school boards and community colleges, it is unlawful for a university board of trustees to exempt a new campus facility from the criteria without the written concurrence of the applicable local emergency management agency or the Department.

.0 EDUCATIONAL FACILITIES AS EMERGENCY SHELTERS

The public shelter design criteria, which are also known as the Enhanced Hurricane Protection Area (EHPA) criteria, were designed to ensure that appropriate new educational facilities can serve as public shelters for emergency management purposes. Public educational facilities primarily serve an educational purpose, and secondarily the social and recreational purposes of the community. Though the hurricane shelter function is considered a secondary function of a public school facility, the public shelter function is a lawfully authorized function, and during a declared state or local emergency can preempt normal educational functions. Therefore, consideration of the emergency management purpose is a critical component of the design of a new educational facility. The following sections will provide consultative guidance for implementing the criteria.

Public Shelter Design Criteria

The EHPA criteria were prepared to ensure that new educational facilities could meet or exceed applicable national design and construction standards, guidelines and "best practices." The EHPA criteria were also developed to significantly enhance the occupant safety of public hurricane shelters, and enhance their ability to survive and continue to serve the public after exposure to a major hurricane.

In particular, the American Red Cross' ARC 4496 must be consulted during the planning process for an EHPA; see Appendix C. ARC 4496 is the minimum hurricane shelter selection guideline used by the Department, American Red Cross and local emergency management officials for surveying, evaluating and designating public hurricane shelters.

ARC 4496 can also be viewed at the following web address:

http://floridadisaster.org/bpr/Response/engineers/documents/newarc4496.pdf

The criteria require that EHPAs be designed, constructed and certified as capable of withstanding wind loads according to the American Society of Civil Engineers Standard 7 (ASCE 7). The criteria also highly recommend increasing the design map wind speed by 40 miles per hour. The Department also highly recommends the 40 mile per hour increase in map wind speed, especially if the EHPA is constructed with tall exterior walls, long span lightweight roof systems, wide roof overhangs, located in open areas with minimal sheltering, etc., which are particularly vulnerable to damage from severe winds.

For additional consultative guidance on design criteria, including wind and debris impact resistance, foundation and floor slab elevation, location and site requirements, shelter capacity, plumbing and sanitation, electrical and emergency power systems, emergency management considerations, etc., please see Appendix G. The Department also recommends two other useful sources of information which should be considered in

2004 Statewide Emergency Shelter Plan

Construction Guidance for Community Shelters (FEMA 361). Phenomena Hazards Design and Evaluation Criteria (DOE-STD-1020), and 2) the Federal Emergency Management Agency's (FEMA) publication Design and the EHPA design process: 1) the Department of Energy's (DOE) Standard Natural

Exemption Criteria

applicable local emergency management agency or the Department. new educational facility from the criteria without the written concurrence of the It is unlawful and a violation of the Florida Building Code for a board to exempt a concurrence of the applicable local emergency management agency or the Department. the EHPA criteria unless specifically exempted by the board, with the written All new educational facilities must be designed and constructed to comply with

and constructed to meet the EHPA criteria. Selection may be based upon costconstruction may be considered as a factor when selecting the facilities to be designed is not a factor that will be considered for an exemption by the Department. Cost of effectiveness, greatest provision of shelter space, and other factors that enhance shelter The fact that the EHPA criteria may increase the cost of construction of a facility

is new, or an entirely new addition connected to an existing building. This includes to be code updated with each new project. The EHPA requirement also applies to reuse and prototype plans, since they are required replacement buildings and new buildings and additions constructed on existing campuses FBC; that is, any construction of a building or unit of a building in which the entire work determined to be "new construction," as defined in s. 1013.01(14), F.S. and s. 423.5.8, The EHPA requirement applies to any building construction project that is

the criteria within any given three-mile radius. The exemption significantly impeded criteria in Florida Statutes, whereby a board was only required to construct one facility to new school construction. Therefore, the Legislature eliminated the three-mile exemption progress towards elimination of the safe public hurricane shelter space deficit through Between 1995 and 2000, there was a "three-mile exemption" for the EHPA

within a facility EHPAs to "core facilities," but permits use of an entire facility, or appropriate areas compliance with the (EHPA criteria)" unless exempted. The statute does not limit states that "A facility, or an appropriate area within a facility...must be built in facilities purposes, and defines "core facilities" to be media centers, cafeterias, toilet facilities" in s. 1013.01(5), F.S. The statutory definition is intended for educational facilities and circulation space (e.g., corridors, lobbies, etc.) Section 1013.372(1), F.S The EHPA requirement is not limited to rooms or spaces defined as "core

2004 Statewide Emergency Shelter Plan

design phase of a new educational facility (thus the term "Enhanced Hurricane Protection shelter environment. time, providing emergency managers and shelter staff with a more manageable hurricane permitted boards and their design professionals to reduce the amount of square footage areas, in some cases whole buildings, and in other cases portions of buildings. useful for a hurricane shelter operation are concentrated into fewer more manageable Area"). Under the EHPA concept, appropriate rooms and spaces that are required or established to more cost effectively create usable hurricane shelter spaces during the required to meet the EHPA criteria, thus reducing construction costs, and at the same During initial development of the EHPA criteria, the concept of "core areas" was lhis

space deficit through new school construction. Therefore, the Legislature eliminated the "core facility area" language from s. 1013.372, F.S. in 2000, and replaced it with "A When this concept was translated into statute and code language, the original language used the term "core facility area" instead of "core area." As with the three-mile significantly impede progress towards elimination of the safe public hurricane shelter exemption, interpretation of the statute and code to mean "core facility" could facility, or an appropriate area within a facility.

emergency. For hurricanes and other severe storms, occupant safety is the primary the hurricane shelter net usable floor area for occupant capacity purposes. gymnasiums, auditoriums and classrooms can be used as EHPA core areas. Also, media cateterias and interior/inside circulation areas, appropriately designed and constructed consideration, regardless of the normal educational purpose of the spaces. In addition to centers and restrooms are normally excluded by emergency managers when calculating defined boundaries, barriers or partitions that have been designated for use during an For emergency management purposes, "core areas" are portions of a facility with

memoranda DPBM No. 99-05 and DPBM No. 02-42 that boards may request cost waivers for statutory limitations on cost per student station, and deduct the additional cost be relaxed, and unless lawfully exempted, it is unlawful to construct a new educational candidates. Section 1013.42(2), F.S. does not indicate that the EHPA requirement may directly associated with the EHPA from the total construction cost when applying for a facility without the EHPA criteria. The Department of Education has stated in The EHPA requirement applies to School Infrastructure Thrift (SIT) award

1013.42 School Infrastructure Thrift (SIT) Program Act.-

Education, and the State Board of Education may adopt rules as necessary to operate the program. To facilitate the program's purposes, the department shall aggressively seek the elimination or revision of obsolete, excessively restrictive, or unnecessary laws, rules, and savings identified as lawful, safe, and cost-beneficial requirements relating to the life cycle of buildings, landscaping, operable glazing, operable windows, radon testing, and firesafety when lawful, safe, and cost-beneficial; and other cost but are not limited to, the elimination of duplicate or overlapping inspections; the relaxation of regulations for the purpose of reducing the cost of constructing educational facilities and related costs without sacrificing safety or quality of construction. Such efforts must include, (2) The School Infrastructure Thrift (SIT) Program is established within the Department of

Both the Florida Statutes and the FBC provide factors to consider in exempting an educational facility from complying with the criteria. The American Red Cross' publication Standards for Hurricane Evacuation Shelter Selection (ARC 4496) also provides supplemental guidance to consider in the exemption process. The following subsections provide consultative guidance when considering an exemption request.

2.2.1 Location

In general, there are five factors to be considered when making an exemption request due to location: I) Location of the proposed EHPA site within an identified Category I, 2 or 3 hurricane evacuation zone; 2) Location subject to hurricane-related rainfall or storm surge flooding or isolation; 3) Location on a coastal barrier island; 4) Location within the evacuation zone of facilities that manufacture, use or store certain types and quantities of hazardous materials; and 5) Low evacuation demand.

Category 1, 2 or 3 Evacuation Zone. New educational facilities located or proposed to be located in an identified Category 1, 2 or 3 hurricane evacuation zone are exempt from the EHPA criteria. Hurricane evacuation zones are applicable to coastal counties, and possibly counties adjacent to Lake Okeechobee. Hurricane evacuation zones include areas that are subject to storm surge inundation, as predicted by the National Weather Service's Sea, Lake and Overland Surges from Hurricanes (SLOSH) model. Category 1, 2 and 3 evacuation zones are subject to evacuation during landfalling major hurricanes, as well as paralleling and exiting major hurricanes.

"Hurricane Evacuation Zones" are areas designated to be evacuated for particular hurricane scenarios to protect an at-risk population from flooding or high winds. Evacuation zones are developed taking into consideration all populated areas having a serious risk of flooding, areas not subject to flooding but may be cut-off or completely surrounded or isolated by flooded areas, and the need to be easily communicated to the public.

Category 4 and 5 hurricanes are relatively uncommon events, and based upon the storm track (landfalling, paralleling or exiting), Category 4/5 hurricane evacuation zones may not be inundated by storm surge. Therefore, new educational facilities proposed to be located in Category 4/5 evacuation zones are not statutorily exempt from the EHPA criteria.

Also, to facilitate communication of evacuation orders to the public during an emergency, hurricane evacuation zones are normally established using geographic, jurisdictional or transportation/utility boundaries and landmarks that are known and readily identified by the local population. Therefore, hurricane evacuation zone boundaries may extend further inland than the SLOSH model's predicted inundation areas. New educational facilities proposed to be located in a Category 4/5 evacuation zone may in fact be outside of the SLOSH predicted inundation areas. EHPAs located in Category 4/5 evacuation zones may provide emergency managers with additional sheltering options.

Category 4/5-related exemption decisions will be dependent upon the magnitude of the county and regional hurricane shelter space deficit, local logistical support capabilities and the availability of suitable alternatives (either in-place, or within the framework of a five-year plan.)

Rainfall or storm surge flooding or isolation. New educational facilities proposed to be located in areas subject to flooding or isolation due to rainfall or storm surge related flooding may be unsuitable for use as public hurricane evacuation shelters. Rainfall flooding meludes closed-basin, riverine and containment failure of dams and reservoirs. Long-term isolation of a hurricane shelter population presents logistical challenges for emergency managers and mass care support agencies, which normally prefer equally suitable buildings not subject to flooding or isolation. The challenges include staff rotation, resupply of food, water and other consumables, emergency medical assistance, sanitation, security concerns, communication, etc. Flooding and isolation-related exemption decisions will be dependent upon the magnitude of the county and regional hurricane shelter space deficit, design and construction standards of the facility, shelter floor elevation, local logistical support capabilities and the availability of suitable alternatives (either in-place, or within the framework of a five-year plan.)

Coastal Barrier Island. Coastal barrier islands are often less than two (2) miles wide with very low ground elevations above mean sea level (AMSL). As such, they are exceptionally at-risk to storm surge inundation, isolation, and exposure to the full force of hurricane winds. Therefore, facilities on coastal barrier islands are often subject to an exemption from the EHPA criteria. Coastal barrier island exemption decisions will be dependent upon the magnitude of the county and regional hurricane shelter space deficit, design and construction standards of the facility, shelter floor elevation, local logistical support capabilities and the availability of suitable alternatives (either in-place, or within the framework of a five-year plan.)

Hazardous Materials. Location of a proposed new educational facility within the Vulnerability Zone (VZ) of facilities that manufacture, use or store certain types and quantities of hazardous materials may make it unsuitable for use as public hurricane evacuation shelter. Just as with flooding isolation concerns, the possible impact of a hazardous materials spill or release presents public safety and logistical challenges to emergency managers and mass care support agencies. In addition to the challenges listed for flooding isolation, hazardous materials emergencies include detecting and communicating presence of a hazard, and implementing shelter-in-place or evacuation actions. Most facilities with reportable quantities of hazardous materials are considered a low risk of hurricane-related spill or release due to presence of mitigation measures (e.g., limited quantities of materials, hardening of containment structures, etc.)

Hazardous materials-related exemption decisions will be dependent upon the potential for and probable impact of a hurricane-related spill or release, potential hurricane shelter's distance from hazardous materials facility, guidance from Local Emergency Planning Committee (LEPC) and local fire department, magnitude of the county and regional hurricane shelter space deficit, communication and warning

alternatives (either in-place, or within the framework of a five-year plan.) capabilities, local logistical support capabilities and the availability of suitable

materials (sometimes in reportable quantities) that are used for janitorial services and determine appropriate precautionary measures recommends consultation with the applicable LEPC and local fire department to therefore rarely a significant consideration for an exemption. The Department materials are normally very limited in quantity, and suitably stored or protected, and maintenance, vocational or laboratory uses, refrigeration, water treatment, etc. Such It should be noted that many educational facilities use or store hazardous

magnitude of the county and regional hurricane shelter space deficit, local shelter demand available. Low evacuation demand exemption decisions will be dependent upon the evacuation demand needs, or possibly exempt the entire facility if a suitable alternative is agency may reduce the EHPA floor area square footage requirement to meet local close proximity to the evacuees they will serve. Therefore, the emergency management Emergency managers and other mass care providers prefer to locate hurricane shelters in framework of a five-year plan.) needs and the availability of suitable alternatives (either in-place, or within the areas with low evacuation demand may be considered for an EHPA exemption. Low Evacuation Demand. New educational facilities proposed to be located in

staffing, feeding, security, etc.), a hurricane shelter located in an area with low evacuation circumstances. To effectively utilize available resources and operational plans (e.g., spaces to as large as several thousand spaces. populated evacuation zone. Public hurricane shelters can range from as small as about 50 demand can be significantly smaller than a hurricane shelter located near a highly The required size of a hurricane evacuation shelter is very dependent upon local

Department of Community Affairs

2004 Statewide Emergency Shelter Plan

3.0 REGIONAL HURRICANE EVACUATION SHELTER REQUIREMENTS

3.1 Methodology for Calculating Regional and County Hurricane Evacuation Shelter Status

Location and Square Footage of Existing Shelters. The location and square footage of existing shelters are located in Appendix A, which provides a detailed inventory of shelter locations and capacities within each county. The tables in Appendix A use the terms "risk" and "host" shelters. Risk shelters include those shelter spaces designated for use during a major hurricane, and host shelters include those spaces available for general use outside of a hurricane impact area. The terms "risk" and "host shelters are further defined in Appendix E.

Location and Square Footage of Needed Shelters. Region/County estimates are provided for Hurricane Categories 4 and 5 for Shelter Capacity, Vulnerable Population, Shelter Demands, Shelter Surpluses/Deficits, and Capacity Results for 2004 and 2009 (in number of persons) in TABLE 3-1. Region/County estimates are provided for Hurricane Categories 4 and 5 for Shelter Capacity, Vulnerable Population, Shelter Demands, Shelter Surpluses/Deficits, and Capacity Results for 2004 and 2009 (in square feet) in TABLE 3-2.

Shelter Demand Sources/Results by County. County shelter demand estimates are provided for Storm Categories 4 and 5, and include shelter demand for 2004/2009, vulnerable populations, percentages of vulnerable populations, and sources (Hurricane Evacuation Studies), in Appendix J.

The 2004 and 2009 populations are estimates, based on county growth during the previous decade (1990-2000) from the Florida Population: Cersus Summary 2000 as prepared by the Bureau of Economic and Business Research at the University of Florida. The Category 4 and 5 Vulnerable Populations from the Regional Hurricane Evacuation Studies were multiplied by the average annual percentage growth per county to derive a base growth rate. This figure was then multiplied by the applicable number of years, between the year that the Hurricane Evacuation Study data was collected, and the year 2004 estimates and the 2009 projections. Finally, this figure was added to the original Category 4 and 5 Vulnerable Populations from the Regional Hurricane Evacuation Studies to derive an estimate corrected for both population growth and the age of the data.

Determining County Shelter Capacities. County shelter capacity data for all 67 counties were updated by local emergency management agencies throughout 2003, and also cross-referenced with the 2003 Shelter Retroft Report. Since 1995, Florida has been implementing of ARC 4496 hurricane shelter selection standards and Florida's Model Hurricane Evacuation Shelter Selection Guidelines. Therefore, based upon subsequent results of regional and county hurricane shelter surveys, local emergency management

2004 Statewide Emergency Shelter Plan

Figure 3-1. Regional Planning Council (RPC) Regions of Florida

Department of Community Affairs

agencies were requested to provide shelter inventory capacities based on those facilities that met the required ARC 4496 standards, and separately those facilities that did not. Those facilities that have not yet been surveyed, and therefore have not yet been documented to meet the above standards, were designated as facilities not meeting the ARC 4496 standards. The total of each county's current shelter capacities (those that meet ARC 4496 standards) was multiplied by the 20 square feet per person (based on EHPA requirement of 20 square feet per person) for general shelter space, and where appropriate, 40 square feet per Persons with Special Needs (PSN) Shelters.

Determining County Shelter Demand. The hurricane shelter demand percentage for each county reflects the percentage of a county's vulnerable population that is projected to seek public shelter. These percentages are based on the conclusions of the behavioral analyses conducted for each of the regional hurricane evacuation studies. The analyses utilize survey and statistical methodologies to estimate behavioral responses to various hurricane scenarios.

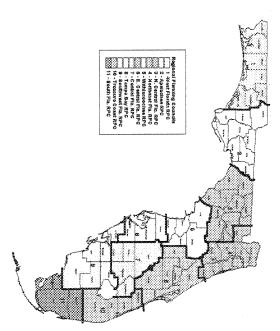

Most of the behavioral analyses in the state have been prepared on a regional basis by Hazards Management Group (HMG) and are therefore a consistent benchmark relative to the survey methodologies and statistical applications. The public shelter use percentages in the behavioral data of the hurricane evacuation study are combined with local income characteristics in general hurricane risk area (two important variables in determining public shelter use) to calculate shelter demand numbers. The only regions or counties where a behavioral analysis, as part of a hurricane evacuation study effort, was not conducted by the Hazards Management Group are East Central Florida, and Central Florida. Nonetheless, shelter demand numbers were provided in the hurricane evacuation study and those figures were used for the purposes of this plan.

The hurricane evacuation studies conducted for all regions of Florida between 1988 and 2000 include shelter demand figures for each county. For this Plan, these data served as the basis for estimating the year 2004 and 2009 shelter demand numbers for Florida's coastal counties. The same methodology for projecting the vulnerable population to the year 2004 and 2009 was used to calculate the estimated shelter demand figures for those years.

3.2 Location and Square Footage of Existing and Needed Shelters

TABLES 3-1 and 3-2 below provide information regarding location and shelter occupant capacity of both existing and needed hurricane shelters (i.e., risk shelters) for each of the 67 Florida counties. The tables also show which regions of the state suffer from a deficit of hurricane shelter space. The tables' columns provide the following information:

Region Number: This column sorts the listing of counties by Regional Planning Council (RPC) Regional Numbers. Figure 3-1 illustrates the RPC regions in Florida.

Shelter Demand in People and Square Footage: The figures for people and square footage are derived using the same methodology of the Category 4/5 Vulnerable Population. The Shelter Demand "In People" figure from the Regional Hurricane Evacuation Studies was multiplied by the sum of the average annual percentage growth times the applicable number of years between the year that the Hurricane Evacuation Study data was collected, and the year 2004 estimates and the 2009 projections. This figure was then added to the original Shelter Demand from the Regional Hurricane Evacuation Studies to derive an estimate corrected for both population growth and the age of the data.

The Shelter Demand for Square Footage was determined by multiplying the Shelter Demand In People by 20 square feet per person for each county. For Monroe

In those cases the shelter demand figures were determined by multiplying the county's hurricane evacuation study derived vulnerable population figures by the public shelter most recent hurricane evacuation study did not provide a specific shelter demand figure. County and the inland counties of the North Central and Withlacoochee RPC regions, the survey for the county or region. use percentages developed in the most recent Hazards Management Group's behavioral

verified through ARC 4496 surveys and/or EHPA construction is not included in this column, but is carried in each county shelter status in Appendix A under the column title: "Risk Capacity In People (Does not Meet ARC 4496 or Not Yet Surveyed)". is based on 40 square feet of usable space per person. Risk shelter capacity that is not yet correlated with available information from county shelter surveys, and the construction of based on 20 square feet of usable space per person. Available PSN risk shelter capacity meeting/exceeding the ARC 4496 standards. Available general risk shelter capacity is EHPAs at schools in each county. The figures were based on shelter capacity footage were provided by each of the 67 county emergency management directors, and Shelter Capacity: 2004 Risk Shelter Capacity figures for people and square

Space for both 2004 estimates and 2009 projections and is based on the Shelter Surplus/Deficit In People figure. a quick reference to determine if the county is deficient in available Risk Capacity Shelter Shelter Demand and the Shelter Capacity in both measurements. This data is provided as Surplus/Deficit figures for In People and Square Footage is the difference between the Shelter Surplus/Deficit In People and Square Footage: The 2004 Shelter

4.0 TYPES OF PUBLIC FACILITIES THAT SHOULD COMPLY WITH PUBLIC SHELTER DESIGN CRITERIA

By statute, all suitable public facilities are subject to being used as public hurricane evacuation shelters in a declared state or local emergency. Therefore, any suitable new public facility should include the EHPA criteria. This includes not only public educational facilities, but also certain types of state and local government facilities. In general, facilities that are designed for public assembly, either as a primary or auxiliary use, may be appropriate for use as public shelters during an emergency. At this time, only public educational facilities are subject to the EHPA criteria by statute and code. This is primarily due to the fact that public educational facilities account for nearly 95 percent of current public hurricane shelter space, and relatively few other state and local facilities are appropriate for use as public shelters.

The public shelter space may be located in a single building or a complex of buildings, placed in a single large room or a complex of rooms in close proximity to each other, or in one or more stories of multistory building(s), preferably with a means of inside circulation and convenient access to toilets.

To determine if a proposed new public facility should be subject to the EHPA criteria, regardless of non-educational function or agency with ownership, the proposed facility should be reviewed based upon the exemption criteria given in Section 2.2 of this Plan. Facilities not subject to an exemption may be appropriate for use as public hurricane shelters. The decision to incorporate the EHPA criteria into a new public facility must be coordinated with the local emergency management agency(s) or the Department.

4.1 Public Schools and Community Colleges

District public schools (K-12) are the primary source of public hurricane shelter space in Florida, accounting for about 93 percent of current capacity. This is due to the fact that schools are widely distributed in populated areas, school facilities are designed for large assembly occupancies with many inherent mass care features (e.g., adequate quantity of toilets, dining/feeding areas, etc.), access to the facilities can be coordinated through a single local agency, etc. The types of school buildings that are potentially appropriate for use as public shelters include gymnasiums, cafeterias, multipurpose facilities, auditoriums, certain classroom buildings, etc.

Community colleges account for only about one (1) percent of current public shelter capacity. Community colleges are regionally distributed, and potentially located in areas with high demands for public hurricane shelter space. Also like K-12 public schools, community colleges are normally designed for large assembly occupancies and possess many inherent mass care features. The types of college buildings that are potentially appropriate for use as public shelters include gymnasiums, cafeterias, multipurpose facilities, auditoriums, certain classroom buildings, etc.

4.2 Charter Schools

Charter schools appear to have a general exemption from meeting many of the requirements of the K-20 Education Code; reference s. 1002.33(16)(a), F.S. However, per s. 1002.33(18), F.S., charter schools are required to utilize facilities which comply with the State Uniform Building Code for Public Educational Facilities Construction, adopted pursuant to s. 1013.37, F.S. (i.e., SREF), or with applicable state minimum building codes. It is the opinion of the Department, in consultation with the Department of Education, that new charter school facilities that either select or are subject to section 423, FBC are subject to the EHPA criteria.

Charter schools may be used to expand the capacity of the public school system. Therefore, under some circumstances, a charter school may replace construction of a new public school facility within a geographic area of a county or region where there is significant demand for public hurricane shelter space. Under normal circumstances, a new public school facility would be lawfully required by statute and code to incorporate the EHPA criteria. If charter schools were exempt, this would limit the ability of both the board and emergency management agencies to reduce the public hurricane shelter space deficit.

Charter schools are eligible to receive state capital outlay funding to support construction, operation, maintenance, repair or other purposes, and such facilities, when located on district property, are subject to reversion to the district school board in the event that a charter school terminates operation. Given the public investment in the facilities, and the magnitude of the hurricane shelter space deficit, certain charter schools should be required to comply with the EHPA criteria.

The following are factors to be considered in determining if a specific new charter school facility should incorporate the EHPA criteria: 1) are state capital outlay funds supporting the construction project; 2) does the project meet the definition of "new construction" as defined in s. 1013.01(14), F.S. or s. 423.5.8, FBC; 3) would the facility be subject to an exemption per s. 1013.372(1), F.S., due its location, size or other characteristic; 4) would the facility be subject to reversion to the district board if charter school operations terminate; or, 5) will the facility be subject to use as a public hurricane shelter per s. 252.385(4)(a), F.S., because it is owned or leased by a state or local governmental entity.

4.3 State Universities

State university facilities account for only about one (1) percent of current public hurricane shelter capacity. Unlike K-12 public schools and community colleges, state university campuses may not be as widely distributed, though several are potentially located in areas with high demands for public hurricane shelter space (e.g., Florida Gulf Coast University, University of South Florida, etc.) Main campuses and some satellite campuses may have several appropriate buildings concentrated in one (or more)

proximate geographic area. This concentration of shelter spaces reduces staffing and logistical resource demands of a sheltering operation.

State university facilities are normally designed for large assembly occupancies, with many having inherent mass care features. The types of university buildings that are potentially appropriate for use as public shelters include gymnasiums, field houses and sports arenas, cafeterias, multipurpose facilities, auditoriums, certain classroom buildings, etc.

State universities must consider two separate populations when developing their public shelter strategies: 1) campus staff, faculty and their families, and students (both commuters and residential); and 2) the general public. University facilities may be designated for sole use by one population, or concurrent use by both populations, at the discretion of the university board with the concurrence of local emergency management agency or the Department. Residential facilities are not normally subject to the EHPA criteria, but incorporation of the criteria into new residential housing or dormitories (or portions thereof) will free up additional hurricane shelter space for the general public in appropriate non-residential facilities.

4.4 State and Local Public Facilities

Local public facilities account for about four (4) percent of current public hurricane shelter capacity. (Privately-owned and non-educational state-owned facilities account for less than one percent of the hurricane shelter space inventory.) Given their administrative function (and essential emergency function of certain facilities) most state-owned, county-owned and municipally-owned facilities are not appropriate for use as public hurricane shelters. Administrative office and support areas, data and word processing rooms and areas, record vaults, etc., are exempt from the EHPA criteria. However, certain other types of public facilities may be appropriate, such as community or civic centers, meeting halls, auditoriums, exhibition halls, sports arenas, conference or training centers, and other public assembly facilities.

5.0 RECOMMENDED SOURCES OF FUNDING

School districts have generally been reporting that the construction cost premium for incorporating the EHPA criteria is about two (2) to six (6) percent. For most new facilities, this appears to translate into a construction cost premium of less than \$500,000. These are small, but not necessarily inconsequential, costs that must be borne by state and local agencies. Therefore, s. 1013.372(2), F.S. requires that the Department recommend an appropriate and available source of funding for the additional cost of constructing emergency shelters. There is no dedicated state source of funding to support construction of EHPAs, so the Department recommends use of existing state capital outlay funds.

5.1 Public Schools, Community Colleges and University Facilities

The only significant and applicable funding source available at this time for district public schools, community colleges and universities is Public Education Construction Outlay (PECO) funds. These funds are earmarked for site acquisition and improvements necessary to accommodate buildings, equipment, and other structures of district school boards, community colleges and universities. Therefore, the Department recommends PECO funds, which are an appropriate and available source of state funding

5.2 Department of Management Services Facilities

If the additional cost of adding emergency shelter capabilities to a new Department of Management Services (DMS) building is not very large (e.g., less than five percent) such that the project remains financially supportable by the rental rate, then the EHPA-related cost premium can be included in the overall construction amount financed via bond issue. An analysis should be performed to ensure that the bondholders' interest in the new facility is not compromised.

Alternatively, the additional cost can be added to the General Revenue component of the project funding request. Although the construction of buildings may be financed, some general revenue funding must be included in the overall budget request for various non-construction costs such as architectural and engineering fees, land acquisition and impact assessments. The funding for non-standard items (e.g. equipment, ancillary facilities) are also typically included as general revenue in request.

5.3 Other Mitigation Funds

From time to time, some federal and state mitigation-related funds may be available to support the construction cost premium for improving hurricane-resistance above minimum code requirements for new facilities. As an example, some mitigation programs may share the cost of increasing the design wind speed by the EHPA criteria's

recommended 40 miles per hour. The principal federal/state mitigation program is the Hazard Mitigation Grant Program (HMGP). However, the HMGP is not considered normally "available" for most new construction projects, since its grant cycles are often associated with disaster declarations. The HMGP also has a pre-disaster mitigation (PDM) grant cycle which is nationally competitive. Information on the mitigation programs can be obtained through state and local emergency management agencies.

5.4 Global Match Considerations

Global match is the pooling of multi-agency investments and resources to achieve a common goal. By agreement with the Federal Emergency Management Agency, Florida can pool state and local expenditures for improved hurricane-resistance of facilities to use as non-federal cost-share for HMGP projects.

Documented construction cost premiums of EHPA projects, that exceed minimum hurricane-resistance code requirements, can be used by the board and state and local emergency management agencies as non-federal cost-share (or match) for HMGP funded projects. As an example, the documented construction cost premium to increase the design wind speed of a new school facility by the code recommended 40 miles per hour is \$300,000. Assuming the new school facility project meets other HMGP programmatic requirements (e.g., eligibility, benefit-cost, etc.), the \$300,000 can be used as the state and local match to support other hurricane-resistance retrofit projects; such as, installing window protection on another facility that can be used as a public hurricane shelter.

Global match has been used to create an estimated 162,000 public hurricane shelter spaces since 1999. The Department requests that boards document the construction cost premium of EHPA construction projects, and forward the information to the local emergency management agency and the Division. The documentation must specifically separate hurricane-resistance mitigation construction costs from other non-mitigation costs. As an example, the cost premium due to installation of heavier roof joists at a closer spacing is eligible, but installing additional toilets is not eligible.

6.0 STATEWIDE PROGRESS TOWARD ELIMINATING THE PUBLIC HURRICANE EVACUATION SHELTER SPACE DEFICIT

The Division has statutory responsibility and authority to administer a statewide program to eliminate the deficit of "safe" hurricane shelter space. To accomplish this objective, the Division has implemented a multifaceted program. This program includes: 1) survey of existing buildings, both public and private, to identify suitable shelter capacity; 2) where cost effective (and practical), support mitigation and retrofitting of facilities to increase shelter capacity; 3) construction of new facilities to meet the EHPA criteria; 4) shelter demand reduction through improved hurricane hazard models and behavioral studies; and, 5) improve public information/education to reduce unnecessary "shadow" evacuations.

Since 1995, the Division has been performing a survey of existing designated and potential hurricane shelters. To date, the Division has completed more than 68 percent of the survey, and projects that the baseline survey will be completed by 2005. The initial findings of the survey were not encouraging. The vast majority of the designated hurricane shelters were in buildings that did not meet the ARC 4496 guidelines. As examples, the pre-survey designated hurricane shelters rarely had adequate (if any) window protection (83 percent), and were often constructed with long span roofs (41 percent) and unreinforced masonry walls (43 percent). The initial results of the survey began, for the first time, to quantify the actual condition of Florida's hurricane shelter inventory, instead of relying on anecdotal concerns that had been expressed for more than 20 years. However, during the survey process, hundreds of thousands of spaces were identified that only required minor retrofitting (e.g., window protection) to meet the ARC 4496 guidelines.

Between 1995 and 2000, the reported hurricane shelter space deficit increased considerably; from about 361,000 in 1996 to more than 1.5 million in 2000. During this time-frame, less than 200,000 hurricane shelter spaces could be documented, primarily in the southeastern and east-central coastal regions of the state. This capacity was principally the result of post-Hurricane Andrew HMGP funding of public school window protection projects. No other significant source of funding had been identified to support the minor retrofit projects being documented during the survey process.

Concurrently, legislation in s. 235.26(9)(a), F.S. (superseded by 1013.372(1), F.S.) stated that all new educational facilities for which a design contract was entered into after July 1, 1995 were required to incorporate the public shelter design criteria. However, the criteria did not become effective until April 28, 1997, and it is not unusual for there to be a three-year delay between promulgation and availability of the first group of compliant facilities. Therefore, minimal progress was made prior to 2000 via construction of new public schools to the EHPA criteria.

By 2000, the reported hurricane shelter space deficit peaked as the strategy originally directed by Chapter 93-211, Laws of Florida, began to produce results. As a benchmark, the 2000 Statewide Emergency Shelter Plan reported that Florida had a statewide hurricane shelter space deficit of more than 1.5 million spaces. This reported deficit affected every region of the state, but especially the southern and central regions of the peninsula. This did not irriply that in any given storm that 1.5 million evacuees would simultaneously seek public shelter, but reflects the state's cumulative hurricane shelter space deficit. State and local emergency managers and other public officials prefer that persons ordered to evacuate for a hurricane stay within their home county or region, and not evacuate long distances. The 2000 Statewide Emergency Shelter Plan's published statewide and regional deficits served to quantify the challenge that lay ahead

The 1999 Legislature appropriated more than \$2.2 million to support a hurricane shelter retrofitting initiative. The appropriation stipulated that the funds be used to shutter school buildings for use as hurricane shelters. The Department used the 1999 Shelter Retrofit Report to identify and prioritize projects to receive the funds. A total of 58 projects were selected, which created an estimated 34,928 spaces. The 2000 Legislature followed-up with an additional \$18 million (combined federal, state and local funds) to complete the projects listed in the 1999 Shelter Retrofit Report. The 2000 appropriation included funds from the Hurricanes Floyd and Irene federal HMQP declaration, which were earmarked to support the state's effort to reduce the deficit of hurricane shelter space. Since 2000, subsequent Legislatures have appropriated more than \$10 million in additional state funds to support projects recommended in subsequent Shelter Retrofit Reports. These appropriations have created about an additional 92,867 hurricane shelter spaces.

The 2003 Shelter Retrofit Report can provide additional information concerning Florida's hurricane shelter survey and retrofit program. The 2003 Shelter Retrofit Report can be viewed at the following web address:

http://floridadisaster.org/bpr/Response/engineers/documents/03ShelterRetrofit.pdf

Since 1995, through federal, state, and local retrofitting of suitable facilities, Florida has created a total of about 410,000 public hurricane shelter spaces. The "Retrofitted / Mitigated Capacity Gained" column of Table 6-1 demonstrates county-by-county progress toward eliminating the hurricane shelter space deficit by retrofitting appropriate facilities to meet ARC 4496. The majority of this retrofit capacity has been created since 1999. Though regions and counties with the greatest deficits received priority for available retrofit funds, there has been a more widespread distribution of the retrofit funds due to the statewide nature of the deficit. Some of the retrofited facilities have less than preferred mass care characteristics (e.g., conveniently located toilet facilities, etc.), but the retrofit program produced a rapid improvement in the safety of Florida's hurricane shelter inventory.

Creation of hurricane shelter capacity through construction of new school facilities to the EHPA criteria has also increased since 1999. Local emergency management and school board officials have reported that about 209,600 EHPA shelters spaces have been created. The "EHPA Capacity Gained" column of Table 6-1 demonstrates county-by-county progress toward eliminating the hurricane shelter space deficit via EHPA construction. The application of the EHPA criteria has been inconsistent across the state, with several counties reporting construction of relatively few (if any) EHPAs. EHPA spaces account for about one-third (1/3) of the state's total capacity of ARC 4496 hurricane shelter spaces. However, as with any program, "institutionalization" takes time to evolve, and progress is being made.

Cumulatively, since 1995, the Division's hurricane shelter survey and retrofit program has directly or indirectly led to identification or creation of about 434,000 hurricane shelter spaces that meet ARC 4496 guidelines. The EHPA construction program has created about 209,600 hurricane shelter spaces. Therefore, by the 2004 hurricane season, Florida will have a total of about 643,700 shelter spaces that meet ARC 4496 guidelines.

Florida is also reducing its hurricane shelter deficit by implementing new technologies, such as Light Detection And Ranging (LIDAR), and improved SLOSH computer models. These new technologies have been able to more precisely determine which areas are vulnerable to hurricane storm surge. As a result of these improved techniques, new hurricane evacuation studies have been performed, which in many cases either removed certain areas from storm surge zones, or at least minimized the surge height predicted.

Armed with new storm tide atlases and hurricane evacuation studies, local emergency management officials are then able to refine their designated evacuation zones for each storm scenario. Smaller evacuation areas represent less people at risk. Fewer people at risk means fewer evacuees. Fewer evacuees translates into reduced shelter demand. Two examples are Broward and Miami-Dade counties. Through a LIDAR project, Broward County was able to reduce its number of hurricane evacuees by about 250,000 residents, which reduced shelter demand by an estimated 37,500 spaces. Miami-Dade County was also able to reduce its evacuation zones through more precise ground survey methods. Its new evacuation zones reduce the number of those who must evacuate by approximately 395,000, which reduced shelter demand by an estimated 59,250 spaces.

Hurricane shelter demand has also been reduced through adjustments to reflect more current and accurate census information (i.e., 2000 census vs. 1990 census), and changes in the methodology of Hurricane Evacuation Studies. Historically, 25 percent or more of a hurricane vulnerable population were projected to seek safety in public shelters. Many of the post-1998 Hurricane Evacuation Studies are now indicating that fewer than 15 percent will seek public shelter for a Category 5 hurricane. Since publication of the 2000 Statewide Emergency Shelter Plan, the statewide average demand has fallen from about 24 percent to about 16 percent with publication of this Plan. The practical effect is an apparent reduction in hurricane shelter space demand of 540, 237 since 2000; though in reality this means federal, state and local agencies do not have to invest public funds to create the additional 540,237 "bricks-and-mortar" shelter spaces.

The Department has also developed a public information program to compliment the other hurricane shelter deficit reduction efforts. The Department has educated residents on the hazards they face and how to best deal with them. A key issue is whether or not to evacuate and, if so, to where. Education on the hazards and how they affect a community will lead to residents making better-informed decisions in a crisis. That effort is being supported by public service announcements, hurricane expositions, training of local responders and volunteers, and through emergency messages during times of crisis. This is expected to be a long-term process that will help to reduce the need for public hurricane shelter space.

As can be seen in Table 6-2, the apparent maximum hurricane shelter space deficit of more than 1.5 million, as reported in the 2000 Statewide Emergency Shelter Plan, has been dramatically reduced. Florida's hurricane shelter survey and retrofit program, which includes federal, state, local and private-sector partners, has identified or created about 434,000 shelter spaces, public education agencies have created an additional 209,600 shelter spaces through construction of new school facilities to meet the EHPA criteria, and hurricane shelter space demand reduction measures have proven effective by reducing the apparent 2000 demand by about 540,200 spaces. With publication of this Plan, Florida's hurricane shelter space deficit has been reduced to 592,650 spaces.

Significant progress has been made toward eliminating Florida's deficit of public hurricane shelter space. Since publication of the 2000 Statewide Emergency Shelter Plan, Florida now has 12 counties with demonstrable surpluses of hurricane shelter space. The counties with surpluses include Brevard, Broward, Escambia, Gilchrist, Indian River, Madison, Miami-Dade, Martin, Osceola, Seminole, Union and Washington Also, for the first time in recent history, Florida has a region with a demonstrable surplus of hurricane shelter space. The South Florida Regional Planning Council region (RPC 11), which includes Broward, Miami-Dade and Monroe counties, has a surplus of hurricane shelter space. Since 1995, Florida has reduced its hurricane shelter space deficit by at least 50 percent.

average of about 25,000 retrofitted hurricane shelter spaces per year. The following graph assumes a 25,000 space increase per year via \$3 million in state retrofit funds, and a 75,000 space increase per year via other sources (primarily EHPAs). Together, this will create a combined 100,000 hurricane shelter spaces per year that meet ARC 4496. The Department estimates that by 2011, the state's deficit of hurricane shelter spaces may be Section 215.559(2)(b), F.S., directs an annual appropriation of \$3 million to the Department for shelter retrofit projects. This level of funding is estimated to create an create as many as 340,000 new hurricane shelter spaces. Assuming that this is an average rate of construction, new construction could create about 85,000 EHPA spaces per year. constructed between 2000 and 2003. This quantity of square footage could potentially eliminated. found that about 6.8 million square feet of potentially suitable shelter space was analysis of Florida Inventory of School Houses (FISH) inventory data, the Department to when the hurricane shelter space deficit may be eliminated. Based upon a cursory As can be seen in Figure 6-1, the Department can now make a realistic estimate as

Figure 6-1. Projected Hurricane Shelter Deficit Reduction

Hurricane Shelter Status

Based on 20 square feet per shelter space.
 2009 projected hurricane shelter capacity shown includes only estimated 2004 capacity, which indicates deficit in 2009 if no additional activititing or EHPA capacity is created (i.e., worst-case scenario).

7.0 CONCLÚSIONS

As a result of Hurricane Andrew and the Lewis Commission Report, the State of Florida recognized the necessity of providing safe hurricane shelter space for its residents during disasters. Subsequently, 1013.372(2), Florida Statutes, requires that the Department of Community Affairs submit to the Governor and Cabinet for approval, every two years, the Statewide Emergency Shelter Plan. The Plan provides a listing of "safe" public shelter spaces (and square footage) versus estimated shelter demand for each county, Regional Planning Council region, and the state overall.

The 2004 Plan shows significant progress in reducing the deficit of "safe" public hurricane shelter space in Florida. Since 1995, more than 643,719 hurricane shelter space in Florida. Since 1995, more than 643,719 hurricane shelter spaces have been identified, created through retrofitting of existing buildings, or through new construction (e.g., EHPAs). In the 2000 Plan, the estimated shelter demand was 1,776,606 spaces. Through more accurate mapping of coastlines in certain counties (i.e., LIDAR mapping) and other improved topographic survey techniques, which reduced evacuation zones, and through improved shelter demand studies, the estimated public hurricane shelter demand has been reduced to 1,236,369 spaces for 2004. This is so, despite an increasing state population. Thus the overall state public hurricane shelter deficit has been reduced from 1,501,931 spaces in 2000, to 592,650 spaces in 2004.

For the 2004 Plan, the Department has documented twelve counties that now demonstrate public hurricane shelter space surpluses. The counties with surpluses are Brevard, Broward, Escambia, Gilchrist, Indian River, Madison, Miami-Dade, Martin, Osceola, Seminole, Union and Washington. Also for the first time, Florida has a region (RPC region 11) with a demonstrable shelter surplus.

For the future, preliminary estimates indicate that, if the current rate of shelter space production is mannianed, that the public hurricane shelter deficit will be eliminated by 2011. However, the state population is increasing yearly, and over time, current designated hurricane shelter buildings will be decommissioned due to age and other issues (e.g., more preferred alternatives available, etc.) Thus, even once the deficit is eliminated, a "manitenance level" of shelter space production will be necessary to avoid falling back into a deficit situation.

Appendix B: §423.25 Public Shelter Design Criteria

§423.25 Public Shelter Design Criteria.

§4/33.25.1 New Facilities. New educational facilities for school boards and community college boards, unless specifically exempted by the board with the written concurrence of the applicable local amargancy management agency or the Jopantment of Community Affairs (JCA), shall have appropriate core facility areas designed as Enhanced Hurricane Protection Areas (EHPAs) in compilance with this section.

EXCEPTION: Facilities located, or proposed to be located, in a category 1, 2, or 3 evacuation zone shall not be subject to these requirements.

§423.25.1.1 Enhanced Hurricane Protection Areas (EHPA). The EHPA areas shall provide emergency shelter and protection for people for a period of up to 8 hours during a hurricane.

\$423.25.1.1.1 The EHPA criteria apply only to the specific portions of (K-12) and community college educational facilities that are designated as EHPAs.

§423.25.1.2 The EHPAs and related spaces shall serve the primary educational or auxiliary use during non-shelter occupancy.

§423.25.2 Site. Factors such as row everuation demand, size, location, accessibility, and storm surge may be considered by the board, with written concurrence of the local emergency management agency or the DCA, in exempting a particular facility.

§423.25.2.1 Emergency Access. EHPAs shall have at least one route for emergency vehicle access. The emergency route shall be above the 100-year floodplain. This requirement may be waived by the board, with concurrence of the local emergency management agency or the DCA.

§423.25.2.2 Landscaping, Landscaping around the EHPA shall be designed to preserve safety and emergency access. Trees shall not conflict with the functioning of overhead or underground utility lines, or cause laydown or impact hazard to the building envelope.

§423.25 2.3 Parking. During an emergency condition, vehicle parking shall be prohibited within 50 feet of an EHPA. Designated EHPA parking areas may be unpaved.

§423.25.2.4 Signage. Floor plans of the facility, indicating EHPAs, shall be mounted in the emergency manager's office/area.

§423.25.3 Design. EHPAs may be above or below ground and may have more than one story, provided the design satisfies the wind load and missile impact criteria. Modular and open-plan buildings may serve as EHPAs provided the design satisfies the wind load and missile impact criteria.

§423.26.3.1 Excluded Spaces. Spaces such as mechanical and electrical rooms, storage rooms, open corridors, kitchens, science rooms and labs, vocational shop areas and labs, computer rooms, attic and crawl spaces, shall not be used as EHPAs.

§423.25.3.2 Capacity. Fifty percent of the net square feet of a designated educational facility shall be constructed as EHPAs. The net square feet it is determined by subtracting from the gross square feet those spaces such as mechanical and electrical rooms, storage rooms, open corridors, kitchens, science rooms and labs, vocational stipp areas and labs, computer rooms, aftic and crawl spaces that shall not be used as EHPAs. The board, with concurrence of the applicable local emergency management agency or DCA, may adjust this requirement if it is determined to be in its best interest. The capacity of an EHPA shall be calculated at 20 square feet per occupant (adults and children five years or older).

§423.25.3.3 Toliets. Toliet and hand washing facilities should be located within the EHFAs and provided at one bief and one sink per 40 occupants. These required toliet and hand washing facilities are not in addition to those required for normal school occupancy and shall be included in the overall facility fixture count.

\$433.25.3.1 Support systems for the toilats, e.g., bladders, portable toilets, water storage tanks, etc., shall be capable of supplying water and containing waste, for the designed capacity of the EHPAs.

§423.25.3.3.2 Plumbing and valve systems of "normal" tollets within the EHPAs may be designed for conversion to emergency operation to meet the required demand.

\$423.28.3.4 Food Service. Where feasible, include counter tops for food distribution functions in the EHPAs.

§423.25.3.5 Manager's Office. An administration office normally used by a school administrator shall be identified as the EHPA manager's office and shall be located within the EHPA. The office shall have provisions for standby power, lighting, communications, main fire alarm control panel and storage for the manager's equipment.

\$423.26.4 Structural Standard for Wind Loads. At a minimum, EHPAs shalt be designed for wind loads in accordance with ASCE 7-89, "Minimum Design Loads for Buildings and Chrier Structures, Category III (Essential Buildings)." Openings shalt whistand the impact of wind-borne debris missiles in accordance with the impact and cyclic loading criteria per SBC/SSTD 12-99. Based on a research document, "Emergency Shelter Design Criteria for Educational Facilities," 1993, by the University of Florida for the DCE, it is highly recommended by the Department that the shelter be designed using the map wind speed plus forty (40) mph, with an importance factor of 1.0.

\$423.25.4 Missile Impact Criteria. The building enclosure, including walls, roofs, glazed openings, louvers, and doors, shall not be perforated or penetrated by a flying object. For walls and roofs, the missile criteria is as provided in SBC/SSTD 12-99.

§423.26.4.1.1 Materials used for walls, roofs, windows, louvers, and doors shall be certified for resistance to missile impact criteria.

§423.25.4, 1.2 The glazed openings or permanent protective systems over glazed openings shall be designed for cyclic loading.

§423.25.4.2 Roofs Roof decks shall be cast-in-place 4-inch, or more, normal weight concrete. Concrete decks shall be waterproof. Systems other than cast-in-place concrete shall have adequate bearing, anchorage against wind uplift, diaphragm action, and resistance to rain that are equivalent to a cast-in-place system. Exception: Structural pre-cast concrete roofs, composite metal decks with normal weight concrete roofs, or other systems and materials that meet the wind load and missile impact criteria may be used.

§423.25.4.2.1 Light weight concrete or insulating concrete may be used on roof decks of EHPAs provided the roof decks are at least 4-inch cast-in-place normal weight concrete or other structural systems of equivalent strength.

§423.25.4.2.2 Roof openings (e.g., HVAC fans, ducts, skylights) shall be designed to meet the wind load and missile impact criteria.

§4(3):25.4 2.3 Roof coverings shall be specified and designed according to the latest ASTM and Factory Mutual Standards for meterials and wind uplift forces. Roofs shall be inspected by a licensed engineer/architect and a representative of the roofing manufacturer.

§423.25.4.2.4 Roofs shall have adequate slope and drains sized for normal use and shall have emergency overflow scuppers which will accommodate a 2 inch per hour rain for 6 hours.

§423.25.4.2.5 Parapets shall satisfy the wind load and missile impact criteria; roof overhangs shall resist uplift forces.

§423.25.4.3 Windows. All unprotected window assemblies and their anchoring systems shall be designed and installed to meet the wind load and missile impact criteria.

§423.25.4.3.1 Windows may be provided with permanent protective systems provided the protective system is designed and installed to meet the wind load and missile impact criteria and completely covers the window assembly and andonong system.

§423.25.4.3.2 EHPAs without windows shall have mechanical ventilation systems.

§423.25.4.4 Doors. All exterior and interior doors subject to possible wind exposure and/or missile impact shall have doors, frames, anchoning devices, and vision panels designed and installed to resist the wind load and missile impact criteria or such doors, frames, anchoring devices, and vision parels shall be covered with permanent protective systems designed and installed to realist the wind load and missile impact criteria.

§430.264.45 Exterior Envelope. The axterior envelope, louvers over air intakes and vents, and gooseneck type intakes and vents of EHPAs shall be designed and installed to meet the wind load and installed to meet the wind load and installe impact criteria.

§423.25.4.5.1 HVAC equipment mounted on roofs and anchoring systems shall be designed and installed to meet the wind load criteria.

§423.25.4.5.2 Roof mounted HVAC equipment shall have a 12 inch high curb around the roof opening and be designed to prevent the entry of rain water.

§4/23.26.4.6 Foundations and Floor Slabs. Foundations shall be designed to resist all appropriate loads and load combinations, including overfurning moments due to wind. The floor elevation and necessary life safety and other emergency support systems of EI-IPAs shall be elevated above the meanman storm surge inundation elevation associated with a category 4 hurricane event. Storm surge elevations shall be identified by the most current edition of the regional Sea Lake and Overland Surges from Hurricanes (SLOSH) studies and atlases.

§423.25.5 Electrical and Emergency Power System. The EHPA shall be provided with an emergency electrical power system which shall have an outlet for ocupling a backup portable generator. Emergency power, per NEPA 70. Article 700, shall be provided for operation of emergency lights, exit signs, and fire alarm systems in the EHPA. The fire alarm panel shall be located in the EHPA manager's office. A remote annunciator panel shall be located in or adjacent to the school administrator's office. Where economically feasible, an equivalent protovoltaic system may be provided. When generators are installed, the facility shall include an enclosed area designed to protect the generators from winds and missile impact. Air intakes and exhausts shall be designed and installed to meet the wind load and missile impact criteria.

\$432.85.1 EHPA Lighting. Standby lighting within the EHPAs, tollet rooms, and generator spaces should provide at least 10 footcandles of general illumination which can be reduced to 1/2 footcandle in the steeping areas during the hight.

§423.25.5.2 Standby Circuits. Selected ventilation fans, intercom system, and other standby circuits shall be connected to the standby power system per NFPA 70, Article 702 (optional standby circuits). The fire alarm, emergency lighting, and exit signs throughout the entire campus shall remain operational and shall receive first priority to the power provided by the facility's emergency power system per Article 700 of NFPA 70.

§423.25.5.3 Receptacle Outlets. A minimum of four electrical outlets, served with power from the standby circuits, shall be provided in the EHPA manager's office.

§423.25.6 Inspections. EHPAs shall be considered "tweshold buildings" in accordance with Section 553.71(7), F.S., and shall comply with Sections 553.79(5), 553.78(7), and 553.79(8), F.S.

§423.25.6.1 Construction of EHPAs shall be inspected during the construction process by certified building code inspectors or the design architect/engineer(s) certified pursuant to Part XII Chapter 46.8 F.S. and threshold inspectors for compliance with applicable rules and laws.

\$433.256.2 The emargency electrical systems shall be inspected during the construction process by certified electrical inspector or Florida registered professional engineers certified pursuant to Part XII Chapter 466 F.S. skilled in electrical design.

§4/3.25.6.3 EHPAs shall be inspected and recertified, for compliance with the structural requirements of this section, every 5 years by a Florida registered professional engineer skilled in structural design, if any structural system, as specified in this section, is damaged or replaced, the recertification shall be obtained prior to the beginning of the next humbans season.

§423.25.6.4 All shutter systems, roofs, overflow scuppers, and structural systems of EHPAs shall be inspected and maintained annually prior to hurricane season and after a major event. All energency generators shall be inspected under load conditions including activation of the fire alarms, emergency lights as per applicable equipment codes and MFPA standards, and including machanical systems and receptacles connected to the emergency power. Appendix C:
ARC 4496 - Standards for Hurricane
Evacuation Shelter Selection

Furican Societion Standards

Together, we can save a life

American Red Cross

An interagency group comprised of the Federal Emergency Management Agency, the U.S. Army Corps of Engineers, the Environmental Protection Agency and Clamson (Surverdy, has developed Intribate evacuation atteller selection sundards. These standards reflect the application of technical data compiled in formizate evacuation suddens, other leazed information, and research findings related to wired lends and effectival problems. These standards are supplemental to information contained in ARC 3641, Mass Cure: Preparathess and Operations concerning shelter

storm sange and flavol mapping, and other data can now be used to make informed decisions about the satisfility of with local officials responsible for public safety. Technical information contained in Hurricane Evacuation Studies, Planning considerations for lauricatus conceation stations involve a number of factors and require close coordination

In the experience of the American Red Cross, the majority of people evacuating because of a hurricane threat generally provide for themselves or stay with friends and relatives. However, for those who do sock public shelter, safety from the hazards associated with intricates must be assured. These becaute include—

- Rainfall flooding.
- Hazardous materials

The following standards address the risks associated with each of these harricane-associated hazards.

Surge lumidation

In general, hurricane evacuation shelters should not be located in arose vulnorable to hurricage surge intendition. The National Weather Service has developed multiputation andels, such as Sac, t.d.e, and Overland Surges from Hurricases (SLOSH) and Special Program to List Amplitudes of Surges from Hurricanes (SPLASH), that are critical in determining the pretential level of surge insurdation in a given area.

- Carefully review inundation maps in order to locate all hurricane evacuation shelters outside of Category 4 storm surge inundation zones
- Avoid buildings subject to isolation by surge inundation in favor of equally suitable buildings not subject to isolation. Confirm that grunnl oberestions for all potential sholter facilities and access routes obtained from
- copographic maps are occurate.

 Do not locate hurricane eyacuration shelters on barrier islands

Rainfall Flooding

Rainfall flooding must be considered in the Burricane evacuation shelter selection purosis. Riverine initializian areas shown on Flood Insurance Rate Maps (FIRKAs), as prepared by the Hational Flood Insurance Program, should be reviewed. HRMs should also be reviewed in Socialing stellers in infand countries.

- Locate hurricane evacuation shelters untside the 100-year floodplain.

- Avoid selecting hurricane evacuation shelters located within the 5th-year floodplaint.

 Avoid selecting hurricane evacuation shelters in assess likely to be included due to riverine insudation of roadways.

 Make one a hurricane evacuation shelter's find floor elevation is on an equal or higher elevation than that of the base
- I flowt elevation level for the FRRM acca.

 Consider the pro-tunity of styckers to any dants and reservoirs to assess flow upon failure of containment following harricum-related flooding.

insdequate for higher wind speeds. Consideration of any facility for use as a hurricane evacuation shelter must take into account wind hazards. Both design and construction problems may proclinde a facility from being used as a shelter. Local building codes are frequently

- If possible, effect buildings that a structural cogineer has certified as being capable of with/depting wind loads according to ASCE (American Society of Engineers) 7-98 or ANSI (American National Standards Institute) A-58 (1982) structural design criteris, Davidings must be in compliance with all local building and fire
- Fulling a certification (see above), request a structural engineer to rank the proposed furricane evacuation
- shefters based on his or her knowledge and the criteria contained in these guidelines
- Avoid uncertified buildings of the following types: Buildings with long or upon roof spans longer than 40 feet
- -Unreinforced masonry buildings.
- Fre-engineered (sucel pre-fabricated) buildings built before the mid-1980s.
- Buildings with flat roofs or built with lightweight materials Burldings that will be exposed to the full force of hurricane winds.
- Give preference to the following:
- Buildings with 10°-30° piched, hipped roofs; or with heavy concrete roofs.
 Buildings as more than 60 feet high.
- Buildings in sheltered areas (protected from strong winds).

Hazardous Materials

potential hurricane evacuation shelter. The possible impact from a spill or release of hazardous materials should be taken into account when considering any

manufacture, use or store hazardoux materials turriesse evacuation skeller or determine premutionary zoucs (safe distances) for facilities near potential shelters that Committee (LEPC) and the foral fire department. These sources can help you determine the satisfyilly of a petential isserial Sefety Digit Skeets (emergency and hazardous chemical inventory forms) to the Local Emergency Planning All facilities manufacturing, using, or storing hazardous materials (in reportable quantities) are required to admit

- Facilities that store certain reportable types or quantities of huzautous materials may be inappropriate for use as
- Harricane evacuation shelters should not be becased within the sen-mile emergency planning zone (EPZ) of a nuclear
- Chaptes must work with local emergency management officials to determine if tuzzarlous naturials present a consent for potential burifeane evacuation shalters.

Interior Building Safety Criteria During Hurricane Conditions

Based on storm data (e.g., arrival of gate-torce winds), determine a notification procedure with local emergency managers regarding when to move the shelter population to pre-determined safer areas within the facility.

- Do not use gymnasiums, auditorisms, or other large open areas with long roof spans thouger than 40 best) during
- be duspaged and plan accordingly. Avoid areas near glass unitess an adequate shutter protects the glass surface. Assume that windows and the roof wil

- Use interior portions or monts. It is interested to the form of th
- Avoid basements if there is any chance of flooding

Lesst-Risk Decision Making

anticipated demands for hurricans evacuation sheher spaces exceed existing capacity as defined by the preaceting standards, there may be a need to utilize less preferred facilities. It is critical that sheher solection decisions be neade carefully and in cameulation with local covergency management and public antity officials. This process should include carefully and in cameulation with local covergency management and public antity officials. This process should include Safety is the primary consideration fix the American Red Cross in selecting hurricane evacuation sketters. When

- No furricane execustion shelter should be tiesated in an evacuation zone for obvious safety reasons. All hurricane evacuation shehers should be located outside of Category 4 starm savge framelation zones. Cortain exceptions may be meassary, but only if there is a high degree of confidence that the level of wind, min, and sarge activities will not
- surpass established shelter activy margins.

 When a potential furnitions evacuation shelter is located in a flood zone, it is important to consider its viability. By It is essential that elevations be carefully checked to avoid unnecessary problem closes look at the use of a particular facility as a shelseiing location. Zones B, C, and D may allow some flexibility danger of flooding. Zone AH (within the 14th-year flood plain and puddling of 1-3 feet expected) necessitates a comparing elevations of sites with PIRAIs, one can determine if the shelter and a major means of egress are in any
- In the absence of certification or review by a structural engineer, any building schedule for use as a huricane evacuation shelter must be in compliance with all head building and fire codes. Certain exceptions may be necessary, but only after evaluation of each facility, using the slovementioned building safety enterior
- The Red Cross uses the planning guideline of 4D square foot of space per shelter resident. During hurricane conditions, on a short-term basis, shelter space osquirements may be reduced, ideally, this toquirement should be determined using to less than 13 square foot per person. Advantate space must be set uside for registration, health services, and safety and fire considerations. Desater Beatth Services areas should still be planned using a 4th-square feet per person enlautation. On a fouglettern secorety bods, shelved space requirements should follow guidelines established in ARC 3441. Mass Conv. Preparedness and Operations.

Hurricane Evacuation Shelter Selection Process

General procedures for investigating the suitability of a bailding or facility for use as a harricane evacuation shelter are

- Identify viable sites. Essensition and transportation toute models must be considered
- Complete a risk axsessment on each viable site. Gidder all pertinent data from SLOSH and/or SPLASH (axom surge). FIRM (flood hazard) medels; determine the facility base elevation; and obtain hazardous materials information and previous statistic concerning each building's statishing.

 Have a structural engineer evaluate the facility and rate its ability to visitostand wind bands according to ASCE 7-98.
- or ANSI A58 (1982) structural design criteria
- Inspect the facility and complete a Red Cross Facility Survey (ARC Form 65(4) and a Self-Inspection Work Short Off Premises Liability Checklin, in accordance with ARC 3041. Note all potential habitation and the type of construction. Consider the facility as a whole. One weak section may seriously jooparties the integrity of the

Increasing Shelter Inventory

Appendix E: Glossary

Appendix E: Glossary

Board: Unless otherwise specified, means a district school board, a community college board of trustees, a university board of trustees. The term "board" does not include the State Board of Education.

Core Area: Portions of a facility with defined boundaries, barriers or partitions that have been designated for use during an emergency.

Core Facilities: Means the media center, cafeteria, toilet facilities, and circulation space of an educational plant.

Educational Facilities: Means the buildings and equipment, structures, and special educational use areas that are built, installed, or established to serve primarily the educational purposes and secondarily the social and recreational purposes of the community and which may lawfully be used as authorized by the Florida Statutes and approved by boards.

Host Shelter: A facility that is relatively safe and provides essential support services. Facilities are designated as Host Shelters when they are located in an area that is outside the projected path of an approaching hurricane or severe storm. As local conditions are not expected to present hazards such as surge inundation, rainfall flooding, high winds, or hazardous materials which exceed the building codes of the facilities in use, shelter selection guidelines in ARC 4496 do not have to be considered. The shelter population may include evacues who flee from the threat of a hurricane or severe storm in their home counties. For planning purposes, the operational period of a Host Shelter is from 24 hours prior to landfall until 72 hours after landfall of a hurricane or severe storm. A total of 20 square feet of usable floor space per person is recommended in the

Hurricane Evacuation Shelter: A building or facility that conforms to the hurricane evacuation guidelines in ARC 4496, and is intended to shelter persons in the path of a major storm or hurricane. The designation does not imply that a facility is capable of affording complete protection or is free from hazards but only that it meets established safety criteria. See also Storm Shelter and Risk Shelter.

calculation of shelter capacity

Hurricane Evacuation Zones: Areas designated to be evacuated for particular hurricane scenarios to protect an at-risk population from flooding or high winds. Evacuation zones are developed taking into consideration all populated areas having a serious risk of flooding, areas not subject to flooding but may be cut-off or completely surrounded and isolated by flooded areas, and the need to be easily communicated to the public.

Long:range planning: Means devising a systematic method based on educational information and needs, carefully analyzed, to provide the facilities to meet the goals and objectives of the educational agency for a period of 5 years.

Glossary (continued)

Long Span : See Open Span

Mitigation: Actions taken to prevent or reduce the risk to life, property, social, economic activities, and natural resources from natural or technological hazards.

Net Usable Floor Area: the floor area of included spaces reduced to account for partitions and walls, columns, fixed or movable objects, furniture, equipment or other features that under probable conditions can not be removed or stored during use as an hurricane shelter.

New Construction: Means any construction of a building or unit of a building in which the entire work is new or an entirely new addition connected to an existing building or which adds additional square footage to the space inventory.

Open Span: An area in a structure where the clear distance between supporting elements (beams, columns, etc.), in the shortest direction, is 40 feet or more.

Recovery Shelter: A facility that is relatively safe and provides essential support services. Facilities designated as Recovery Shelters are used after there is no longer a threat of hurricane or severe storm in the area. All Host Shelters and those Risk Shelters that have essential support services may be used as Recovery Shelters. As local conditions are not expected to present hazards such as surge inundation, rainfall flooding, high winds, or hazardous materials which exceed the building codes of the facilities in use, shelter selection guidelines in ARC 4496 do not have to be considered. The shelter population may include evacuees from the local area or evacuees who flee from the threat of hurricane or severe storm in their home counties and are not yet cleared to return to their homes. For planning purposes, the operational period of a Recovery Shelter is from 72 hours after landfall and beyond. A total of 40 square feet of usable floor space per person is recommended in the calculation of shelter capacity.

Reduction Factor: Factors used to reduce the net floor area in order to allow for furnishings, walkways, etc., resulting in the net usable floor area.

Remodeling: Means the changing of existing facilities by rearrangement of spaces and their use and includes, but is not limited to, the conversion of two classrooms to a science laboratory or the conversion of a closed plan arrangement to an open plan configuration.

Renovation: Means the rejuvenating or upgrading of existing facilities by installation or replacement of materials and equipment and includes, but is not limited to, interior or exterior reconditioning of facilities and spaces; air:conditioning, heating, or ventilating equipment; fire alarm systems; emergency lighting; electrical systems; and complete roofing or roof replacement, **Glossary (continued)**

E-2

by wind and pressure forces of a storm or hurricane.

Storm Surge: An abnormal rise in water level at the shoreline of a large body of water caused

including replacement of membrane or structure. As used in this subsection, the term "materials" does not include instructional materials.

Retrofit: Modifications performed upon an existing structure or infrastructure with the goal of significantly reducing or eliminating potential damage due to a specific hazard.

Risk Shelter: A facility that complies with shelter selection guidelines prescribed in Guidelines for Hurricane Evacuation Shelter Selection (ARC 4496, July 1992). Facilities designated as Risk Shelters lie in the projected path of an approaching hurricane or severe storm and who have been

directed to evacuate. The designation does not imply that a facility is capable of affording complete protection or is free from hazards but only that it meets established safety criteria. A total of 20 square feet of usable floor space per person is recommended in the calculation of shelter capacity. See Hurricane Evacuation Shelter and Storm Shelter.

Saffir-Simpson HurricaneScale: The current prevalent system of classifying hurricanes based on five categories that relate hurricane strength and, therefore, damage potential, with the central

pressure, wind velocity, and storm surge.

Shelter: A pre-designated place or building of relative safety that temporarily provides essential support services with the goal of preserving life and reducing human suffering.

Shutters: Permanent or temporary closures or shields and assemblies that serve as a structural barrier to resist wind induced loads that act on their surface(s) to include aerodynamic and Wind-borne debris impact loads.

Site: Means a space of ground occupied or to be occupied by an educational facility or program

SLOSH modeling: A modeling methodology that predicts the maximum envelope and depth of coastal and inland storm surge inundation with respect to categories of hurricane.

Appendix F: Saffir-Simpson Hurricane Scale

The Saffir-Simpson Hurricane Scale

The Saffir-Simpson Hurricane Scale is a 1-5 rating based on the hurricane's present inexasty. This is used to give an estimate of the potential property damage and flooding expocted along the coast from a hurricane landfall. Wind speed is the determining factor in the scale, as storm surge values are highly dependent on the slope of the continental shelf in the landfall region. Note that all winds are using the U.S. 1-minute average.

Category One Hurricane:

Winds 74-95 mph (64-42-kt or 119-153 km/sh.). No real damage to building structures. Damage primarily to unanchored mobile homes, shrubbery, and trees. Some damage to poorly constructed signs. Also, some constal road flooding and amor pier damage. Hurricanes <u>Alligon</u> of 1995 and <u>Damy</u> of 1997 were Category One hurricanes at peak intensity.

Category Two Hurricane:

Winds 96-110 mph (83-95 kt or 154-177 km/hr). Some roofing material, door, and window damage of buildings. Considerable damage to shubbery and trees with some trees blown down. Considerable damage to mobile homes, poorly constructed signs, and piers. Coastal and low-lying secapes routes flood 2-4 hours before arrival of the hurricane center. Small craft is unprotected anchorages break moorings. <u>Hurricane Bonnics</u> of 1998 was a Category Two hurricane when it hit the North Carolina coast, while <u>Hurricane Scorges</u> of 1998 was a Category Two Hurricane when it hit the Florida Keys and the Mississippi Gulf Coast.

Category Three Hurricane:

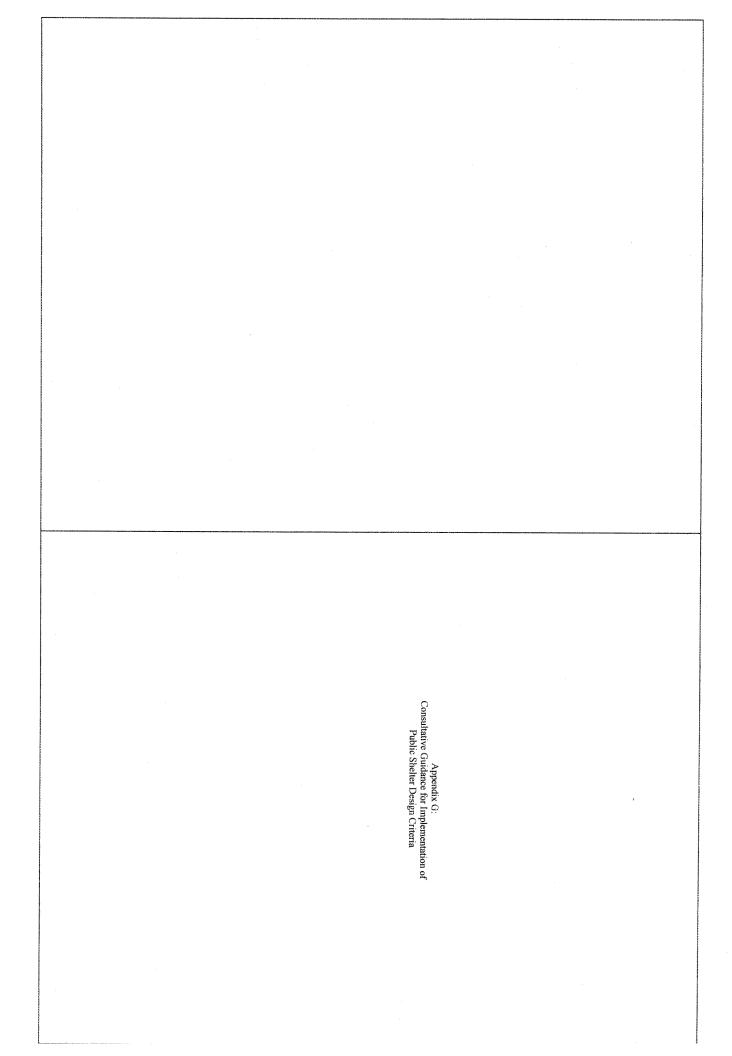

Winds 111-130 mph (96-113 kt or 178-209 km/hy). Some structural damage to small residences and utility buildings with a minor amount of curitainvall failures. Damage to shrobbery and threes with fibilage blown off trees and large trees blown down. Mobile homes and poorly constructed signs are destroyed. Low-lying escape routes are cut by rising water 3-5 hours before arrived of the center of the hurricans. Hooding near the coast destroys smaller structures with larger structures damaged by battering from floating debris. Terrain continuously lower than 5 ft above mean sea level may be flooded inland 8 miles (13 km) or more. Evacuation of love-lying residences with several blocks of the shoreline may be required. Hurricanes Roangige of 1995 and Figat of 1996 were Category Three burricanes at landfall on the Yucatan Peninsula of Mexico and in North Carolina, respectively.

Category Four Hurricane:

Winds 131-155 mph (114-135 kt or 210-249 km/hr). More extensive curtainwall finitures with some complete roof structure failures on small residences. Shrubs, trees, and all signs are blown down. Complete destruction of mobile homes. Extensive damage to doors and windows. Lovelying seages are blown down. Or by using water 3-5 hours before arrival of the center of the hurricane. Major damage to lower floors of structures near the shore. Terrain lower than 10 ft above sea level may be flooded requiring massive exoculation of residential areas as far inland as 6 miles (10 km). <u>Hurricange</u> Lais 6 1995 was a Category Four hurricane while moving over the Leward Islands. Hurricanes: <u>Felix and Oppel</u> of 1995 also reached Category Four status at peak intensity.

Category Five Hurricane:

Winds greater than 155 mph (135 kt or 239 km/hz). Complete roof failure on many residences and industrial buildings. Some complete building failures with small utility buildings bown over or away. All skrubs, trees, and signs blown down. Complete destruction of mobile bounes. Severe and extensive window and door damage. Low-lying escape routes are cut by rising water 3-5 hours before arrival of the counter of the hurricane. Major damage to lower floors of all structures located less than 15 ft above sea level and within 500 yards of the shoreline. Massive evacuation of rasidential areas on low ground within 5-10 miles (8-16 km) of the shoreline may be required. Hurricane Mich of 1998 was a Category Five hurricane at peak intensity over the westorn Caribbean. Hurricane Mich of 1998 was a Category Five hurricane at peak intensity and is one of the strongest Atlantic tropical cyclones of record.

Appendix G -- Consultative Guidance for Implementation of Public Shelter Design Criteria

္ခ PUBLIC SHELTER DESIGN CRITERIA

required level of performance to existing applicable codes and standards. The EHPA criteria are performance-based, hurricane evacuation shelters. The EHPA criteria provide supplemental code provisions with limited prescriptive options provided to serve as a guide toward achieving the developed to ensure that appropriate new educational facilities can serve as public The public shelter design criteria, which are also known as the EHPA criteria, was

evacuation shelters state, local and privately-owned facilities that are suitable to serve as public hurricane Department also recommends use of the EHPA criteria for new state university, and other This section of the code applies to public schools (K-12) and community colleges. Department of Community Affairs

a severe wind event. Localized damage, breach of the structural envelope and flow of carrying systems remain stable and do not collapse. Survival without collapse implies through design and construction of buildings such that, under design loads, primary load to prevent or reduce deaths and injuries within the built environment. essential facilities). philosophy is not necessarily acceptable for public hurricane shelters (and certain other wind through the structure and water damage are acceptable. However, this design that occupants should be able to find an area of relative safety inside the structure during The wind load performance objective of modern building codes and standards is This is achieved

sufficiently intact to protect building occupants and preserve the mass care function. the exterior envelope components, cladding materials and assemblies must also remain not only the structural frame resist collapse in a Category 3 or greater hurricane, but that exposure to a major hurricane. Therefore, the performance expectation for EHPAs is that shelters, and enhance their ability to survive and continue to serve the public after EHPA criteria were developed to significantly enhance the safety of public hurricane scenario is unacceptable to emergency management and other public officials. The designated public shelter progressively disintegrates in a "design level event." This shelterees to find themselves scrambling for safety as the structural envelope of a Hurricane Andrew demonstrated that the potential exists for hundreds of

design wind speed is per ASCE 7's basic wind speed map, using the importance factor (1) Minimum Design Loads for Buildings and Other Structures (ASCE 7). The minimum windborne debris in accordance with Test Standard for Determining Resistance From would invalidate the design), building openings are also required to withstand impact by EHPA remains an enclosed structure (and avoid a partially enclosed condition, which for a Category III or IV (essential facility) building occupancy. Also, to ensure that the with the wind load provisions of the American Society of Civil Engineers Standard 7, G.2.1 Wind Loads. EHPAs are required to be designed and constructed in accordance Windborne Debris SSTD 12 (SSTD 12).

EHPAs, and reflects the minimum national design standard for designated hurricane facility's occupancy. This is the minimum wind design and construction requirement for Category III/IV importance factor (1.15) is used to adjust the wind speed design up to a level, which presumes that 50 years is the useful life expectancy of a facility. public hurricane shelters. ASCE 7's wind speed map is based upon a 50-year recurrence 100+ year recurrence level to account for a greater degree of hazard due to the nature of a The selection of an appropriate design wind speed is critical to the performance of

as 200 miles per hour in the Florida Keys, to as low as 140 miles per hour in inland north The 40 mile per hour increase in base wind speed translates into wind designs of as high Department also highly recommends the 40 mile per hour increase in base wind speed wind speed be increased by 40 miles per hour, with an importance factor of 1.00. The However, the EHPA code provisions highly recommend that the ASCE 7 map

Department of Community Affairs

central Florida. The 40 mile per hour increase in base wind speed is used to adjust the wind speed design up to about a 1,000+ year recurrence level, and is consistent with the Department of Energy's DOE-STD-1020 hurricane wind Performance Category (PC) 3 criteria. The Department of Energy's enhanced performance expectations are that its facilities not only resist collapse, but that occupants, critical equipment and continue to maintain operation as an essential facility. The Department of Energy's enhanced performance expectations are more consistent with public hurricane shelter design and construction performance expectations than ASCE 7's minimum design standard.

DOE-STD-1020-2002 can be viewed at the following web address:

http://floridadisaster.org/bpr/Response/engineers/documents/STD-10202002.pdf

Another consideration when selecting a design wind speed is differences between ASCE 7 and hurricane intensity wind speed measurements. ASCE 7's basic wind speed map uses a 3-second gust wind measurement method. However, the National Hurricane Center (NHC) and National Weather Service (NWS) categorize hurricanes using the Saffir-Simpson Hurricane Intensity Scale, which uses a one-minute sustained wind measurement method. Table G-1 provides a comparison of common wind measurement methods. For comparison purposes, visualize an anemometer (measures wind force and velocity) with Table G-1 representing concurrent scales on its wind speed display dial, similar to a vehicle speedometer that registers vehicle speed in both miles per hour and kilometers per hour. The anemometer will read about 140 miles per hour on the 3-second gust scale when the 1-minute sustained scale reads 111 miles per hour.

Center)						

The NHC defines a major hurricane as one that achieves Category 3 or higher intensity on the Saffir-Simpson Scale; see Appendix F for hurricane category definitions. National guidance also indicates that all of Florida is subject to exposure to major hurricane conditions, with some locations in South Florida and the panhandle region especially susceptible to severe hurricanes. Therefore, to ensure that public hurricane shelters are designed and constructed to resist major hurricanes, the 40 mile per hour increase in base wind speed is critical to achieve the EHPA performance expectation. Table G-2 provides a comparison summary of hurricane shelter performance objectives to be considered when selecting an appropriate design wind speed.

The 40 mile per hour increase in design wind speed is especially important for certain types of buildings. Buildings with tall exterior walls, long span lightweight roof systems, wide roof overhangs, located in open areas with minimal sheltering, etc., are particularly vulnerable to damage in "design level events." The Department strongly recommends use of the 40 mile per hour increase in design wind speed for buildings that possess these characteristics.

The Department also recommends use of exposure C when calculating wind design load, regardless of the design wind speed selected or the environmental conditions surrounding the proposed facility. Both ASCE 7 and the FBC permit use of exposure B in areas more than a mile from the coast, which can significantly reduce the required design capacity of a facility. Use of exposure B is an unconservative approach, which is inconsistent with hurricane shelter performance expectations. Severe hurricanes, like Hurricane Andrew, tend to scour the environment by blowing over trees and flattening lightweight or poorly constructed structures. This scouring reduces the sheltering effect of a facility's normal environment. Strong hurricanes can also produce "micro-burst" and weak to moderate tornado type damage, which can devastate a small area and negate the influence of any local environmental sheltering. Therefore, for consistency with DOE-STD-1020 and the Federal Emergency Management Agency's (FEMA) publication Design and Construction Guidance for Community Shelters (FEMA 361), the Department recommends use of exposure C when calculating design wind load.

The EHPA code recommended 40 mile per hour increase in design wind speed is not intended to achieve a "near absolute" level of protection for building occupants. However, it does provide an "enhanced" (or intermediate) level of protection above minimum ASCE 7 design requirements. DOE-STD-1020's hurricane wind performance category PC-4 and FEMA 361 may be more representative of a "near absolute" level of protection from severe hurricane wind effects.

The EHPA criteria also require that roof assemblies remain waterproof (i.e., rain tight) to preserve the emergency management function. Therefore, roof weather membranes (or secondary rain barriers) must be certified to the wind load requirements.

G.2.2 Windborne Debris Impact. All exterior surface components and cladding materials of EHPAs, and their supporting assemblies, are required to resist windborne debris impact. This includes walls, roofs, windows, skylights, glass block, doors, louvers, etc. This requirement is applicable to all EHPAs, regardless of proposed siting

Department of Community Atlans

in a location outside of the normal windborne debris regions prescribed in ASCE 7 or the FBC. The minimum debris impact standard is SSTD 12. That is, the pertinent cladding materials and assemblies must, at a minimum, resist penetration by a nominal 2"x4" lumber plank weighing nine (9) pounds propelled at 34 miles per hour and striking "endon" and perpendicular to the assembly. The Department also considers products and assemblies acceptable that have been tested and certified to equivalent requirements of the American Society for Testing and Materials (ASTM) Standards E 1886 and E 1996, and the High Velocity Hurricane Zone Testing Protocols TAS 201, 202 and 203. Construction assemblies that are "deemed to comply" with section 1626, FBC, are also considered acceptable.

However, please note that the Department of Education has stated that roof assemblies must be tested and certified to meet SSTD 12 as an assembly. This applies to district school board and community college facilities. With the exception of code prescripted concrete deck assemblies, "deemed to comply" assemblies will not be approved by the Department of Education. Therefore, "deemed to comply" assemblies are only applicable to other state and local agency facilities.

The Florida Department of Education's list of approved roof decks can be found at the following web address:

http://www.firn.edu/doe/edfacil/pdf/roofdecks.pdf

The Department recommends that facilities that may be subjected to an unusual barrage of heavy debris and building wreckage incorporate a more rigorous debris impact standard. This includes facilities that are located within 300 feet of significant exposure to unanchored large object debris sources or poorly constructed/partially engineered buildings. An example is an EHPA facility proposed to be located adjacent to a partially engineered unreinforced masonry building; portions of roof and wall materials, roof top equipment and building contents may be entrained into the wind field as the weak building breaks apart under severe wind loads. This heavy debris can have devastating impacts upon inadequate roof and wall components, cladding materials and assemblies, and potentially create significant breaches in the building's structural envelope. Also, intrusion of heavy debris through the building envelope can present a hazard to building occupants.

For unusual windborne debris hazard exposure, the Department, at a minimum, recommends the hurricane wind hazard debris impact resistance criteria published in DOE-STD-1020. DOE-STD-1020 requires that the facility's exterior envelope components, cladding materials and assemblies resist penetration by a nominal 2"x4" lumber plank weighing 15 pounds propelled at 50 miles per hour and striking "end-on" and perpendicular to the assembly. This is about 360 percent of the impact energy of SSTD 12's impact standard. There are products on the market that have been (or could be) certified to this level of performance, and DOE-STD-1020 provides "deemed to comply" type guidance for roof and wall assemblies. FEMA 361 also provides debris impact design guidance for facilities located in areas potentially exposed to extreme intensity wind events and extraordinary debris impact loadings.

FEMA 361 can be viewed at the following web address:

http://www.fema.gov/fima/fema361.shtm

Location and Site Requirements

- emergency management agency or the Department. A potential EHPA with access routes access for emergency vehicles that is above the 100-year floodplain. However, this G.3.1 Emergency Access. EHPAs are required to have at least one major means of below the 100-year floodplain may be subject to isolation due to hurricane rainfall Therefore, this requirement can be waived by the board with concurrence of the local requirement may be impractical in some areas due to generally low-lying topography dooding, and should be reviewed as a potential exemption request per section 2.2.1 of
- objects within 300 feet of the EHPA's perimeter should be anchored to avoid generating large windborne, falling or roll-over debris. Vehicles must be parked more than 50 feet diameters that do not exceed about six (6) inches. Structures, equipment and other within 50 feet of an EHPA should be limited to hurricane tolerant species with trunk avoid lay-down or impact hazard for the EHPA and its occupants. Trees and shrubs natural gas, etc. Trees, utility poles or other tall structures are required to be located to underground utilities, including, electricity, telecommunications, potable and waste water, preserve safety and emergency access. Trees must not conflict with overhead or from the perimeter of the EHPA during hurricane conditions G.3.2 Landscaping and Parking. Landscaping around the EHPA must be designed to

Hurricane Shelter Capacity

more than one building. To begin the EHPA capacity calculation process, identify those constructed to meet the EHPA criteria. The calculated EHPA capacity is used by board large room or a combination of rooms, located on one or more stories, and possibly in related requirements (potable water, toilets, sinks, parking, etc.) EHPAs may be a single staff, emergency managers and design professionals to determine the infrastructure-F.S. serve as guides for identifying excluded space. rooms or spaces that are to be excluded. Section 423.25.3.1, FBC and s. 252.385(4)(b), Fifty percent of the net square feet of new educational facilities is required to be

The following is a summary of the excluded spaces:

Excluded Spaces. Spaces such as mechanical, plumbing, electrical, telephone and communication equipment rooms, storage rooms and closets, exterior/outside circulation and corridors, restrooms and shower areas, kitchen and food preparation rooms, science labs, computer and information technology labs, vocational and industrial technology labs and shops, library and media rooms and labs, administrative office and support areas, record vaults, attics and crawl spaces.

Included Spaces. All other rooms and areas not listed as an excluded space

To determine the net square feet of EHPA floor area, subtract the floor area square feet of excluded spaces from the gross square feet of the facility. The board, with the concurrence of the local emergency management agency or the Department may adjust the list of excluded/included spaces or the formula for calculation of design capacity.

To be consistent with the Department's statewide hurricane shelter survey and retrofit program, the capacity of an EHPA may be based upon "net usable floor area" inlieu of net floor area. Net usable floor area is defined as follows:

Net Usable Floor Area. Floor area of included spaces reduced to account for partitions and walls, columns, fixed or movable objects, furniture, equipment or other features that under probable conditions cannot be removed or stored during use as a hurricane shelter.

The following empirical reduction factors can be used to determine net usable floor area:

- Reduce the gross floor area of assembly areas with concentrated furnishings or fixed seating by 50 percent. Examples are auditoriums amphitheater classrooms, etc. To calculate a room's net usable floor area, multiply gross floor area by a reduction factor (RF) of 0.50.
- Reduce the gross floor area of assembly areas with unconcentrated
 furnishings and without fixed seating by 35 percent. Examples are
 conference rooms, educational classrooms and skills labs, dining areas,
 band and music rooms, etc. To calculate a room's net usable floor
 area, multiply gross floor area by a RF of 0.65.
- 3. Reduce the gross floor area of assembly areas with open floors and without fixed seating by 15 percent. Examples are gymnasiums, dance floors, exhibition galleries, open multipurpose rooms, interior/inside circulation corridors and areas, etc. Retractable seating is not considered fixed seating. To calculate a room's net usable floor area, multiply gross floor area by a RF of 0.85.

Department of Community Affairs

2004 Statewide Emergency Shelter Plan

A more comprehensive list of Department of Education room design codes, descriptions and RFs is available in Appendix H. Reduction values listed are empirical in that they are based upon large-scale typical conditions. Boards, local emergency management agencies and design professionals may adjust the empirical reduction factors to address site-specific conditions.

The capacity of an EHPA is calculated using 20 square feet per occupant. The FBC formula is as follows:

(Gross Floor Area, sq.ft. - Z. Excluded Floor Areas, sq.ft.) / 20 = Occupant Capacity

To calculate occupant capacity based upon net usable floor area, the formula is:

 \sum (Included Gross Floor Areas, sq.ft. x RF) / 20 = Usable Occupant Capacity

It should be noted that in an emergency, on a short-term basis during hurricane conditions, the American Red Cross and emergency management officials may temporarily reduce the occupant floor area requirement to 15 square feet per occupant. This emergency contingency measure does not affect the EHPA criteria's requirement to use 20 square feet per occupant to calculate design capacity.

3.5 Plumbing and Sanitation

It is essential that the EHPA remain a safe and sanitary environment. The plumbing and sanitary provisions of the EHPA criteria are primarily based upon the American Red Cross's publication Mass Care—Preparedness and Operations (ARC 3041). ARC 3041 requires that emergency shelters, regardless of cause(s) necessitating their need, provide a minimum level of service.

In general, support systems for toilets, sinks and other essential water distribution and disposal systems are required to be capable of supplying water and containing waste for the design capacity of the EHPA. Plumbing and valve systems of toilets and sinks within the EHPA may be designed for conversion to emergency operation to meet the required demand. The method selected to achieve the required level of performance is at the discretion of the board, design professionals and emergency management agencies.

G.5.1 Potable Water. The EHPA criteria do not specify a minimum potable water requirement. ARC 3041 requires a minimum of five (5) gallons of potable water per person per day for all uses (i.e., drinking water, hygiene, food preparation, etc.) Given that the EHPA planning assumption is 8-hours, or one-third (1/3) of a day, the Department recommends that the minimum potable water requirement be one-third of the ARC's daily requirement, or 1.67 gallons per person for all uses. A minimum of one quart per person should be for drinking water purposes. As an example, an EHPA with a design occupant capacity of 100 persons (includes both shelterces and management staff) will require a minimum of 167 gallons of potable water. This is a relatively small quantity of water if it must be extended for up to 24 hours, so conservation measures are

Department of Community Affairs

recommended (i.e., identify and provide access to sources for clean non-potable water for toilet flushing and certain other hygrene activities, etc.)

The potable water can be provided by on-site wells or water treatment package plants, stored in a permanent flow-through tank, or less preferably, stored in temporary containers or bladders. Since temporary systems will be infrequently used (possibly less than once a year), they will require regular maintenance to ensure operational viability. Large volume tanks must also be monitored to assure sufficient chlorine residual. Systems that rely on pumps or other electro-mechanical equipment will require a back-up power supply.

In some circumstances, an alternative to large volume tank storage, and its associated plumbing and valve systems, is on-demand delivery of potable water. If this approach is used, the EHPA will need a delivery and protected storage area for the bulk water. This approach has significant benefits and drawbacks. The benefits are minimal (or no) construction costs associated with this approach, and there are no recurring maintenance or contamination concerns. The drawbacks are logistical and financial: who is going to be responsible for ordering, receiving, distributing, paying for, and if necessary, disposing of the water in time of need? These issues are not show-stoppers, but require a written agreement to assure operational viability.

G.5.2 Tollets and Sinks. Both ARC 3041 and the EHPA criteria require one (1) toilet and one (1) sink per 40 occupants of design capacity. The toilets and sinks can be fixed units incorporated into the EHPA during design and construction, or less preferably portable toilets and hand washing facilities. The EHPA required toilets and sinks are not in addition to those required for normal school occupancy, and are to be included in the overall facility fixture count. Generally there are sufficient quantities of toilets and sinks required for normal school occupancy capacity to meet the EHPA requirement. The designer will need to consider placement of the fixtures such that the needs of both the normal school occupancy and the EHPA requirements are served. EHPA required toilets and sinks must be accessible from within the protected area, or must be accessible via a protected passageway that meets the EHPA criteria. Portable chemical toilets may also require separation from occupied spaces and circulation of fresh air.

G.5.3 Showers. Given that the EHPA criteria assumes only an 8-hour occupancy, ARC 3041's normal shower requirement can be relaxed. Therefore, showers are not an EHPA code requirement. However, boards and design professionals should consider that post-hurricane recovery shelters normally require one (1) shower per 40 occupants.

G.5.4 Waste Water. The EHPA criteria requires that the plumbing system be capable of containing (or otherwise disposing of) the waste water generated by the design capacity occupant load. This can be accomplished through installation of storage tanks, a waste water treatment package plant, or other suitable measure. It is critical that waste water be prevented from backing up into the EHPA.

For those facilities with an on-site waste water lift station, the lift station reservoir can be sized to meet the storage requirement. If this method is selected, the Department

recommends that the reservoir capacity be based upon a 24-hour design occupant capacity instead of the 8-hour design capacity (i.e., 5 gallons) cocupant instead of 1.67 gallons). The lift station reservoir must be set at a lower elevation than the EHPA to prevent back-up of waste water into the shelter area. The lift station should also be equipped with an emergency back-up power system to support drainage into the local utility system. As a contingency, the stored waste water can be drained and properly disposed of by a mobile unit.

G.5.5 Garbage Disposal. The Department recommends that janitorial service areas be located within the EHPA, and provisions be considered for temporary storage or disposal of solid wastes and garbage.

3.6 Electrical and Emergency Power Systems

Back-up and emergency power provisions are an important feature for hurricane evacuation shelters. Utility electrical power can be disrupted for a few hours to several days (or possibly weeks) following arrival of hurricane conditions. During a utility electrical power outage, EHPAs must remain a safe and santiary environment. Lifesafety systems must continue to function, minimal lighting must be provided to support safe movement, security and emergency egress needs, and adequate ventilation provided to maintain a habitable environment.

At a minimum, the EHPA criteria require installation of an emergency electrical power system with an outlet for coupling to a back-up portable generator. The EHPA criteria do not require installation of a permanent electrical power generator, but rely on "pre-wiring" the facility's electrical system to accept expeditious and safe installation of a compatible portable generator. Therefore, the minimum EHPA requirement relies upon on-demand delivery of a compatible electrical power generator. If the on-demand approach is used, the EHPA will need a protected storage area for the generator.

The on-demand approach has significant benefits and drawbacks. The benefits are reduced initial construction costs, minimal recurring maintenance expenses and no fuel-degradation concerns. The drawbacks are logistical and financial: who is going to be responsible for ordering, receiving, installing, maintaining, refueling, redeploying and paying for the generator in time of need? Very few, if any, boards or local government agencies possess an adequate quantity of compatible portable generators to meet EHPA requirements. Also, state and federal agencies do not normally deploy portable emergency power generators until at least 24 hours after impact by hurricane conditions. These issues are not show-stoppers, but require emergency power provisions be included in board and local facilities and emergency operations plans (and possibly a written agreement) to assure operational viability.

Boards and design professionals must note that state and local emergency management agencies are under no statutory or code obligation to provide portable emergency generator(s) for EHPAs. Boards and design professionals are responsible for

sanitary environment for a minimum of the required 8-hour design occupant capacity developing an appropriate EHPA emergency power capability to maintain a safe and

Emergency Management Considerations

communications. include both internal (within the EHPA) and external (to outside shelter support agencies) fire alarm control panel and storage for the manager's equipment. Communications may office is required to have provisions for standby power, lighting, communications, main office be identified for shelter management use and included within the EHPA. The G.7.1 Shelter Manager's Office. The EHPA criteria require that an administrative

area, and an additional 40 square feet per assistant manager(s), communications person(s) functions = 120 sq.ft.) The communications person(s) may be located in adjacent spaces should have about 120 net square feet of floor area (i.e., 40 sq.ft. x 3 management manager occupy a single office area with equipment storage, the shelter manager's office and equipment storage. As an example, assuming the shelter manager and assistant recommends that the shelter manager's office be a minimum of 40 square feet of net floor upon a minimum of 40 square feet per staff person. Therefore, the Department management needs. ARC 4496 recommends that shelter management functions be based The EHPA criteria do not specify a minimum floor area requirement for shelter

Educational Facilities Planners A

Ö

SUBJECT Hurricane Shelters in New Educational Facilities

Wayne V. Pierson A-

The Department of Education has again been asked to return to the requirement that all construction of new educational Socilities, including appropriate core facility additions to existing buildings, incurporate enhanced hurricane protection areas in their design. Section 235.26(8)(a), F.S., states the following:

agency or the Department of Community Affairs. Any educational facility located or proposed to be located in an identified eategory 1, 2, or 3 evacuation zone is not subject to the requirements of this subsection. If the regional planting council region in which the country is located does not have a hurricane evacuation shelter deficit, as determined by the Department exetapted from using the new electer active is to is location, size, or other characteristics by the applicable local emergency management of Community Affairs, school districts within the planning council region are not required to code must be built in compliance with the amended code unless the facility or a part thereof is entered into subsequent to the effective done of the inclusion of the public shelter criteria in the "A facility, or an appropriate core facility area within a facility, for which a design contract is incorposate the public sheller criteria into their construction of educational facilities."

October 31, 2001 DBPM No. 02-42

The State Requirements for Educational Pacifists, Section 7(24)(a), and the Florida Building Code, Section 423(24)(s), provides:

"New educational facilities for school boards and community college boards; unless specifically extended by the board with the written consumments of the applicable board management genery or the Department of Cognitionity Affairs (DCA), shall have appropriate orts facility areas designed as Enhanced Hurricane Protection Areas (EHPAs) in compliance with this section."

1.2(56), SREF, and Section 423(4)(th), Florids Building Code, which includes additions to existing buildings. There are three exceptions: 1) if the new work is specifically excepted in writing by the applicable local energency management management, 31 if the new buildings (s) or addition is located in a category 1, 1, 2, or 3 procuration zone, and 3) if the local regional pitanning council region does not have a shelter deficit. The exception for one shelter within a three-mile radius no longer exists. New educational facilities have been interpreted to mean "bew construction," as defined in Section

deficit in shelter space can be eliminated. In this light, you are encouringed to work with your county emergency management office prior to or during the development of a project to identify appropriate shelter space. The additional cost directly associated to the Enhanced Flurricant Protection Area (EHPA) is deducted from the total construction cost when applying for a SIT award. it is imperative that shelter space as provided in all appropriate new educational facilities so that the

Management for the Department of Community Affairs has identified a lapse in enforcement of the shelter criteria by school districts and community colleges. Of the 164 constructed or newly planted facilities examined by the auditor, one-third the not comply with the required shelter requirements. Please note that the October 2001 Audit Roport Number 02-055 for Hurricane Shelters and Grant
